Nevada COBOL

Nevada Cobol is a Cobol compiler designed for the CP/M operating system. It is supplied with a full-screen editor, **HiSoft ED80**, for entering your Cobol programs. The complete package consists of:

Nevada Cobol manual
ED80 manual
Master disk

which follows this introduction
a separate manual detailing the editor

First of all though, you should backup your master disk - the exact details of this process will depend on your computer type.

Back up your Master Disk

Whichever computer you have you should write-protect your master disk now so that you can't destroy it accidentally.

PCW8256/8512/9512 Owners

We supply the **Nevada Cobol** master disk in a format known as *Old System Format*, as this is readable on all Amstrad CP/M computers.

Unfortunately, the DISCKIT utility supplied with the PCW machines is unable to copy disks in this format. To make a backup copy, you first must create a new blank disk. To do this, load up CP/M by turning off your computer, turn it on again and insert side 2 of your original system disk. When CP/M has booted you will see an A> prompt at the left-hand edge of the screen.

If you have two drives then:

1. Format a new disk in drive A using DISCKIT.
2. Put the **Nevada Cobol** master in drive B and type:

B: [ENTER]
WP B: A: [ENTER]

You now have a backed-up copy in drive A.

If you only have one drive then:

1. Format a new disk in drive A using DISCKIT.
2. Put the **Nevada Cobol** master in drive A and type:

THINCOPY [ENTER]

and then follow the instructions to change disks. This will copy all the programs on the master disk onto your newly-formatted disk via the RAM disk.

CPC464/664/6128 owners

Owners of the Amstrad CPC machines can use DISCKIT2 or DISCKIT3 to make a backup copy of the Nevada Cobol disk.

Other CP/M Computers

You should format a new, blank disk then copy all the files from your master disk to your new disk using PIP, as described on page 89 of the **Nevada Cobol** manual.

The READ.ME File

There is normally a file called **READ.ME**, as **Nevada Cobol** may be updated and improved from time to time; any recent changes will be described in this file which should be listed to the printer and stored with your manual.

Getting Started

Cobol programs need to be created using a text-editor and we recommend **HiSoft ED80**, which is included in this package. The use of the editor is described in the accompanying manual. Alternatively you may use any other editor that produces ASCII files, such as WordStart in non-document mode if you prefer, though please note that Locoscript is *not* suitable.

Use of the compiler is detailed in the Cobol manual proper which follows this introduction, and it is recommended you start on page 88 when first using the package.

Other Programs from HiSoft

Many other language and utility programs are available for your CP/M computer from HiSoft. Among these are **Devpac80** (macro assembler, front-panel debugger, full-screen editor), **Pascal80** (standard Pascal compiler, very fast), **HiSoft C** (Kernighan & Ritchie integer C compiler), **FTL Modula-2** (superb, full Modula-2 compiler with interactive editor), **ZBASIC** (an easy-to-use BASIC compiler), **Nevada FORTRAN** (ideal for learning the language), and **Knife Plus** (disk recovery for Amstrad computers).

PREFACE

This manual is organized for quick reference to the most frequently needed information. Sections I through IV correspond to the four COBOL DIVISIONS while Section V is the INTRODUCTION.

***** **Important** *****

If you are reading this manual for the first time start with SECTION V. And, Section VI contains information on how to get started.

This manual assumes you already know how to program in COBOL and have read the CP/M operating system manuals. If you are a beginner be sure to read the COBOL Primer section.

ACKNOWLEDGMENT

This acknowledgment has been reproduced from the "CODASYL COBOL Journal of Development, 1978-79" and "American National Standard Programming Language COBOL, X3.23-1974" as requested in those publications.

Any organization interested in reproducing the COBOL standard and specifications in whole or in part, using ideas from this document as the basis for an instruction manual or for any other purpose, is free to do so. However, all such organizations are requested to reproduce the following acknowledgment paragraphs in their entirety as part of the preface to any such publication (any organization using a short passage from this document, such as in a book review, is requested to mention "COBOL" in acknowledgment of the source, but need not quote the acknowledgment):

COBOL is an industry Language and is not the property of any company or group of companies, or of any organization or group of organizations.

No warranty, expressed or implied, is made by any contributor or by the CODASYL Programming Language Committee as to the accuracy and functioning of the programming system and Language. Moreover, no responsibility is assumed by any contributor, or by the Committee, in connection therewith.

SECTION I**IDENTIFICATION DIVISION****IDENTIFICATION**

FUNCTION: To identify the source program for documentation purposes.

FORMAT:

IDENTIFICATION DIVISION.

PROGRAM-ID. program-name.

[AUTHOR. comment entry.]

[INSTALLATION. comment entry.]

[DATE-WRITTEN. comment entry.]

[DATE-COMPILED. comment entry.]

[SECURITY. comment entry.]

RULES:

1. This entire Division is for documentation purposes only and is treated as comments by the compiler. However, the required key words are checked, so all text must be in upper-case and follow the COBOL rules.

EXAMPLE:

0001 IDENTIFICATION DIVISION.

0002 PROGRAM-ID. TEST1.

0003 AUTHOR. ELLIS COMPUTING.

0004 INSTALLATION. SAN FRANCISCO PROGRAMMING CENTER.

0005 DATE-WRITTEN. JANUARY 11, 1979.

0006 DATE-COMPILED. JULY 15, 1981.

0007 SECURITY. COPYRIGHT 1979 ELLIS COMPUTING.

0008* comment lines with * in column 5 can be lower-case.

COPY**COPY**

FUNCTION: The COPY statement inserts text into the source program at compile time.

FORMAT:

COPY u:file-name .

RULES:

1. A COPY cannot occur within another COPY.
2. The disk unit (u:) is optional. The current logged-in disk drive will be used as the default if the unit is not specified.
3. The COPY statement should be preceded by a space and terminated by a period, normally, starting in column 7.
4. The file type is not part of the COPY statement but must be type CBL.

EXAMPLE:

```
0001 IDENTIFICATION DIVISION.  
0002 PROGRAM-ID. TESTCOPY.  
0003 COPY A:FILE1.  
0008 COPY A:FILE2.  
0015 COPY B:FILE3.
```

the following represents a separate file named FILE1.CBL to be included (copied) by the above copy statement line 0003.
0004 AUTHOR. ELLIS COMPUTING.
0005 INSTALLATION. SAN FRANCISCO PROGRAMMING CENTER.
0006 DATE-WRITTEN. JANUARY 25, 1982.
0007 DATE-COMPILED. JANUARY 25, 1982.

SECTION II**ENVIRONMENT DIVISION****ENVIRONMENT**

FUNCTION: To identify the computer upon which the program is to be compiled and executed.

FORMAT:

ENVIRONMENT DIVISION.

CONFIGURATION SECTION.

SOURCE-COMPUTER. comment [WITH DEBUGGING MODE].

OBJECT-COMPUTER. comment

{ MODULES }
{ WORDS }

[MEMORY SIZE integer-1{ CHARACTERS}]

[MEMORY BEGINNING integer-1 ENDING integer-2]

[PROGRAM COLLATING SEQUENCE IS ASCII] .

SPECIAL-NAMES. [CURRENCY SIGN IS literal-1]

[DECIMAL-POINT IS COMMA] .

RULES:

1. The generated object code uses memory up to integer-1 CHARACTERS (upper-address limit), if specified. Format 2 specifies a MEMORY BEGINNING address and an ENDING address used to relocate CALLED programs. If these clauses are not used the generated object code will use all available contiguous memory.
2. At compile time the Compiler uses all available contiguous memory.
3. When WITH DEBUGGING MODE is specified, lines with "D" in column 5 are also compiled.
4. PROGRAM COLLATING SEQUENCE IS ASCII is treated as comments by the compiler since the machine collating sequence is ASCII.

5. The literal which appears in the CURRENCY SIGN IS literal clause is used in the PICTURE clause to represent the currency symbol. The literal is limited to a single character and must not be one of the following characters.

- a. digits 0 thru 9;
- b. alphabetic characters A, B, C, D, L, P, R, S, V, X, Z, or the space;
- c. special characters '*', '+', '- ', ',', '; ', '(', ')', '" ', '/ ', '='.

If this clause is not present, only the currency sign is used in the picture clause.

6. The clause DECIMAL-POINT IS COMMA means that the function of comma and period are exchanged in the character-string of the PICTURE clause and in numeric literals.

7. Integer-1 and integer-2 in the MEMORY SIZE clause are addresses. Users with relocated versions please remember to adjust these addresses upwards.

EXAMPLE:

```
0011 ENVIRONMENT DIVISION.  
0012 CONFIGURATION SECTION.  
0013 SOURCE-COMPUTER. 8080-CPU  
0014     WITH DEBUGGING MODE.  
0015 OBJECT-COMPUTER. 8080-CPU  
0016     MEMORY SIZE 16383 CHARACTERS.  
0017* the following line would be used for called programs.  
0016     MEMORY BEGINNING 16384 ENDING 32767.
```

MEMORY MAP

```
0000-----0000
I
0100----- beginning of runtime package -----0100
I
I           12K runtime package
I
2E00-----2E00
I your COBOL object code gets loaded starting here!
I           and continues up ...
I
I           and...
I           continues loading down from the top of
I           memory or the memory ending statement.
I           So loading takes place in both directions!
I
I-----I
I your called program can go anywhere as long as
I it's +1 byte above the calling program's
I ending memory statement.
I-----I
I           a second or third called program could go here
I
I           up to the bottom of cp/m which varies on each
I           machine. be careful when porting to other
I           machines that you don't overwrite cpm !!!
I-----bottom of cp/m-----I
I
I           cpm
I
I-----end of memory -----I
```

INPUT-OUTPUT**INPUT-OUTPUT**

FUNCTION: To name each file and to specify the associated external hardware devices.

FORMAT:

INPUT-OUTPUT SECTION.**FILE-CONTROL.**

SELECT file-name-1 ASSIGN TO

{PRINTER}
{DISK}

[, ORGANIZATION IS {SEQUENTIAL} {RELATIVE}]

[, ACCESS MODE IS {SEQUENTIAL} {RANDOM}]

[RELATIVE KEY IS data-name-1]

[RECORD DELIMITER IS STANDARD]

[, FILE STATUS IS data-name-2].

I-O-CONTROL.

SAME [RECORD] AREA FOR file-name-1, file-name-2... .

RULES:

1. Each file-name-1 must be unique.
2. The RECORD DELIMITER statement cannot be used with the PRINTER.
3. When the RECORD DELIMITER statement is specified, each record is variable length and separated by a carriage return and line feed.

4. On a delimited write, the record to be transferred is first searched from right to left for the first non-blank character and the delimiter is placed one position to the right of it. The record including the delimiter is then transferred.

5. On a delimited read, the record is transferred from left to right until the record area is filled or until a delimiter is detected in the incoming data. The delimiter is not transferred to the user area. If the data record is shorter than the record area space, the previous data remains unaltered.

6. Data-name-2 must be defined in the WORKING-STORAGE section as a two (2) character alphanumeric data item.

Position 1 (STATUS KEY 1)	Position 2 (STATUS KEY 2)
0=Successful completion	0=No information available
1=AT END	X=SEE ERROR CODES
2=INVALID KEY	
3=PERMANENT ERROR	
9=SEE STATUS KEY 2	

7. ORGANIZATION IS RELATIVE applies only to fixed length DISK files. If this clause is not specified then ORGANIZATION IS SEQUENTIAL is assumed.

8. The RELATIVE KEY uniquely identifies each record in a RANDOM file by an integer greater than zero which specifies the records logical ordinal position in the file. For example, the tenth record is the one addressed by relative record number 10 and is in the tenth record area.

9. The RELATIVE KEY is multiplied by the record size and divided by the physical block size and the block is retrieved.

10. The RELATIVE KEY is always an unsigned integer with size 7 or less in the WORKING-STORAGE SECTION.

11. SAME RECORD AREA is for documentation purposes only.

12. A RELATIVE file is created with a fixed length sequential write program to allocate the file space.

13. When RECORD DELIMITER is not specified the records are output in fixed length format each one the size of the longest record description for that file.

14. On INVALID KEY the user record area results are unspecified (filled with padding 1AH characters).

15. On fixed length read when the last record is short the remainder of the user area is filled with padding characters.

16. On a DELIMITED read when a short record is read the results to the right of the last valid input character are unspecified (whatever was there from before the read). Its a good idea to move spaces to the record area before each read.

17. On a DELIMITED read if the input data contains a tab character (09H) it is passed to the user unchanged. If we expanded the tabs then we could not use packed decimal data types because of the possibility of 09H a valid combination in packed decimal, so we don't process the tabs. This allows the use of packed decimal (COMP-3) data types in DELIMITED files. CP/M has a program called PIP that can be used to expand tab characters. See CP/M manual for PIP (T) option.

18. If the DISK is SELECTed, then the information will be associated with the DISK. However, if the PRINTER is SELECTed, you have the option of sending information to the PRINTER or DISK. The choice can be made at compile time or at run time depending on which LABEL RECORDS clause is chosen in the (FD) File Description entry, described latter.

EXAMPLE:

```
0021 INPUT-OUTPUT SECTION.  
0022 FILE-CONTROL.  
0023   SELECT OLD-PAYROLL-MASTER-FILE  
0024     ASSIGN TO DISK  
0025     ORGANIZATION IS SEQUENTIAL  
0026     ACCESS MODE IS SEQUENTIAL  
0027     RECORD DELIMITER IS STANDARD  
0027     STATUS IS STA-1.  
0028   SELECT LISTING ASSIGN TO PRINTER.  
0029   SELECT NEW-PAYROLL-MASTER-FILE  
0030     ASSIGN TO DISK  
0031     ACCESS MODE IS RANDOM  
0032     RELATIVE KEY IS KEY3  
0033     STATUS IS STA-2.
```

NOTE: Also see sample programs at end of manual!

COPY**COPY**

FUNCTION: The COPY statement inserts text into the source program at compile time.

FORMAT:

COPY u:file-name .

RULES:

1. A COPY cannot occur within another COPY.
2. The disk unit (u:) is optional. If not specified the default drive is used.
3. The COPY statement should be preceded by a space and terminated by a period, normally, starting in column 7.
4. The file type is not part of the COPY statement but must be type CBL.

EXAMPLE:

```
0011 ENVIRONMENT DIVISION.  
0012 COPY A:FILE4.  
0013* the following copy looks for FILE5.CBL on the default  
0014* drive  
0015 COPY FILE5.
```

SECTION III**DATA DIVISION****DATA DIVISION**

FUNCTION: To specify the particular characteristics of each file.

FORMAT:

DATA DIVISION.

FILE SECTION.

FD file-name

[, BLOCK CONTAINS integer-1 {CHARACTERS}]
 {RECORDS }
LABEL{RECORDS ARE STANDARD}
 {data-name-1}
VALUE OF FILE-ID IS {literal-1}
 {RECORD IS }
[DATA {RECORDS ARE} record-name-1 [record-name-2]].

RULES:

1. BLOCK CONTAINS clause is for documentation purposes only.
2. LABEL RECORDS ARE STANDARD must be used for all disk files and may be used for printer files.
3. VALUE OF FILE-ID must also be used for all disk files and may be used for printer files.
4. Literal-1 is a 1-14 character file name and disk unit. The disk unit is optional and if not present at run time the currently logged-in disk unit will be used.
5. To send output directly to the printer specify VALUE OF FILE-ID IS "A:PRINTER". Any other file-name sends the output to the disk.

6. LABEL RECORD IS OMITTED can only be used for SELECTed PRINTER files and sends output directly to the printer which cannot be redirected at run time. Also, if this clause is used then the clause VALUE OF FILE-ID cannot be used.

However, if the clause LABEL RECORDS ARE STANDARD is used in conjunction with a SELECTed PRINTER file, then the clause VALUE OF FILE-ID must be used. This combination allows the user the choice of redirecting the printer output to the disk at compile time or run time.

At compile time, the user can specify the printer by using a literal which contains the key word PRINTER. Any other name will be treated as a disk file name and the information will be sent to it. If the file does not exist it will be created.

If the user wishes to reassign the printer at run time, then a data-name is used in place of the literal. The key word PRINTER is used as the value of the data-name if the information is to be sent to the printer. Any other name will send the information to the disk. If the disk file does not exist it will be created.

EXAMPLE:

```
0041 DATA DIVISION.  
0042 FILE SECTION.  
0043 FD NEW-PAYROLL-MASTER-FILE  
0044      LABEL RECORDS ARE STANDARD  
0044      VALUE OF FILE-ID IS "A:MASTER.ACT"  
0045      DATA RECORDS ARE HOURLY, SALARY.  
0046* note record descriptions go here. see next examples  
0066 FD LISTING LABEL RECORDS ARE STANDARD  
0067* note the next line sends data directly to the printer  
     * see cp/m STAT command for printer assignment  
     * using the LST: to serial or parallel port  
0067      VALUE OF FILE-ID IS "PRINTER"  
0068      DATA RECORD IS PRINT-LINE.  
0100 FD THE-SOURCE LABEL RECORDS ARE STANDARD  
0101      VALUE OF FILE-ID IS THE-FILE  
0102      DATA RECORD IS DISK-IN.  
0103 FD LIST-SPPOOL  
0104      LABEL RECORDS ARE STANDARD  
0105* note the next line sends data to disk file for later  
0105* printing. see cpm TYPE command using control-p.  
0105      VALUE OF FILE-ID IS "B:LIST.TXT"  
0106      DATA RECORD IS PRT-LINE.  
0107 FD LIST2  
0108* note the next line sends data directly to printer  
0108      LABEL RECORD IS OMITTED  
0109      DATA RECORD IS PRT-LINE2.
```

RECORD DESCRIPTION**RECORD DESCRIPTION**

FUNCTION: To specify the particular characteristics of data items.

FORMAT:

```

{data-name-1}
level-number {FILLER} [REDEFINES data-name-2]
    [, OCCURS integer-1 TIMES]
        [{PIC} ]
        [, PICTURE] IS {character-string-1}]
        [{SYNC} ] [{LEFT} ]
        [{SYNCHRONIZED} [{RIGHT}]]
        [{JUST} ]
        [{JUSTIFIED} RIGHT]
        [BLANK WHEN ZERO]
            [{COMP} ]
            [{COMP-3} ]
            [{DISPLAY} ]
            [{COMPUTATIONAL-3} ]
        [, USAGE IS {COMPUTATIONAL}]... .
    
```

WORKING-STORAGE SECTION.

same as above and

```

{[ALL] literal}
{QUOTE} {[HIGH-VALUE} }
{ZERO} {[LOW-VALUE} }
[, VALUE IS {SPACE}]... .
    
```

LINKAGE SECTION.

same as above without value clauses.

RULES:

1. Level-number must be an integer between 01 and 49 or 77.
2. The VALUE clause cannot be used in an item which also contains an OCCURS or REDEFINES clause.
3. The OCCURS clause cannot be used in a 01 or 77 level entry.
4. The WORKING-STORAGE area must be initialized before use, as its initial value is unspecified.
5. The plural forms of SPACE, ZERO, HIGH-VALUE, LOW-VALUE and QUOTE can be used.
6. A PICTURE clause must be specified only for elementary items.
7. The maximum number of characters allowed in character-string-1 is 30.
8. The character-string-1 describes the characteristics and editing requirements of the data. It describes the size of the data, the editing to be performed on the data, and the category of the data. There are five types of data that can be described with a picture clause:
 - A. Alphabetic character strings contain the symbols 'A' and 'B'. The contents of the alphabetic described item can be any combination of the (26) letters of the Roman alphabet and the space character from the COBOL character set.
 - B. Numeric character string contain the symbols '9', 'S', and 'V'. The number of digit positions that can be described must range from 1 to 18 inclusive. The contents of the numeric described item can contain the Arabic numerals 0-9 and +,- signs.
 - C. Alphanumeric character strings contain the symbols 'A', 'X', '9'. Its contents can be any printable ASCII character.
 - D. Alphanumeric edited character strings contain the symbols 'A', 'X', '9', 'B' '0' '/'.
 - E. Numeric edited character strings contain the symbols 'B', '/', 'V', 'Z', '0', '9', ',', '.', '*', '+', '-', '\$', 'CR', 'DB'.

The individual characters are described as follows:

Each A represents a character position that can contain only a letter of the alphabet or a space.

Each B represents a character position into which the space character will be inserted.

The S indicates the presence (but not the representation nor the position) of an operational sign, and must be written as the leftmost character in the picture string.

The V indicates the location of the assumed decimal point and may appear only once in a character string.

Each X indicates a character position that may contain any allowable character from the ASCII set.

Each Z represents a leading numeric character position; when that position contains a zero, the zero is replaced by a space character. Each Z is counted in the size of the item.

Each 0 represents a character position into which the numeral zero will be inserted and is counted in the size of the item.

Each 9 represents a character position that contains a numeral and is counted in the size of the item.

Each comma represents a character position into which a comma will be inserted and is counted in the size of the item.

The period represents a character position into which the period will be inserted and is counted in the size of the item. It also is used for alignment purposes.

The minus sign (-) represents a character position into which the editing sign control symbol will be inserted and is counted in the size of the item.

The plus sign (+) represents a character position into which the editing sign control symbol will be inserted and is counted in the size of the item.

Each asterisk represents a leading numeric character position into which the asterisk (*) will be inserted and is counted in the size of the item.

The currency symbol (\$) represents a character position into which the (\$) is inserted and is counted in the size of the item.

The credit and debit symbols (CR) (DB) each represent two character positions into which they will be inserted and are counted in the size of the item.

9. The USAGE IS clause determines the format of numeric data items stored internally and externally. The default value is DISPLAY which represents ASCII format with the sign stored in the units position bit 7. A positive sign is a 0 bit and a negative sign is 1 bit. Thus a negative number prints as a lower case letter (-500 = 50p) unless it is moved to an edited field. COMPUTATIONAL-3 (COMP-3) directs the compiler to store digits two to the byte in packed decimal format with the sign stored in the right hand end 4 bits. A positive sign is 0000 and a negative sign is 0001. COMPUTATIONAL (COMP) directs the compiler to store values in binary Intel 8080 format with a maximum value of decimal 32767. No matter how the COMP picture is described 9 or 9999, the compiler always assigns 2 bytes for storage.

10. Binary data types should not be used in delimited files because of the possibility of duplicating the delimiter character.

11. When moving numeric values greater than 32767 to a binary data type the results are unspecified. For purposes of data conversion to binary the value 67.000 is greater than 32767 if the binary picture is 99V999.

12. Justified can only be used with elementary data items and cannot be used with numeric or edited picture items.

13. REDEFINES must not be used in Level 01 entries in the File Section. Use the Data Records clause and repeated level 01's for multiple records in the file section.

14. COMP & COMP-3 may be used at the group level.

EXAMPLE:

```
0047 01  HOURLY.
0048  02 PAY-TYPE PICTURE IS X.
0049  02 FIRST-NAME PICTURE IS X(20).
0050  02 LAST-NAME PICTURE X(20).
0051  02 SOC-SEC-NUM PIC 9(9) USAGE IS COMP-3.
0052  02 ITM1 PICTURE IS X.
0053  02 ITM11 REDEFINES ITM1 PIC 9.
0054  02 INCOME PIC S9(16)V99.
0055  02 TAXES OCCURS 10 TIMES PICTURE IS S9(10)V99.
0056 01  MONTHLY.
0057  05 FILLER PIC X.
0058  05 GRP-ITM.
0059  10 GRP-ITM2.
0060  15 GRP-AMT PIC 9(6)V99.
0061  15 GRP-AMT-1 PIC 9(6)V99.
0056 01  PRINT-LINE PICTURE IS X(132).
0081 WORKING-STORAGE SECTION.
0082 01  INVENTORY.
0083  02 PART-NUM PICTURE 9(5) USAGE IS COMP-3.
0084  02 QTY-IN-STOCK PIC 9(6) COMP-3.
0085  02 W-INDEX PICTURE 99 VALUE IS 01 COMP.
0086  02 W-ITM2 PIC X(5) VALUE "TEST1".
0087 01  A-TABLE.
0088  02 T1 PIC X(5) VALUE "FIRST".
0089  02 T2 PIC X(5) VALUE "SECND".
0090  02 T3 PIC X(5) VALUE "THIRD".
0091 01  B-TABLE REDEFINES A-TABLE.
0092  02 ORDER OCCURS 3 TIMES PICTURE X(5).
0093 01  EDIT.
0094  02 E-1  PICTURE $, $$, $$, $$, $$, $$, $$, $.99CR.
0095  02 E-2  PIC 99V999+.
0096  02 E-3  PIC ZZ,ZZZ,ZZZ.99-.
0097  02 E-4  PIC $, $$, $$, $.99DB.
0098* by using the ACCEPT verb the next file name can be
0099* changed at object time
0100 01  THE-FILE PICTURE X(14) VALUE "A:FILENAME.WRK".
0101 01  KEY3 PIC 9(7) COMP-3 VALUE 1.
0102 01  STA-1.
0103  02 KEY1 PIC X.
0104  02 KEY2 PIC X.
0105* maximum record or item size is 4095
0106 01  BIG-ITEM PIC X(4095).
```

COPY**COPY**

FUNCTION: The COPY statement inserts text into the source program at compile time.

FORMAT:

COPY u:file-name .

RULES:

1. A COPY cannot occur within another COPY.
2. The disk unit (u:) is optional and if not present the default drive is used.
3. The COPY statement should be preceded by a space and terminated by a period, normally, starting in column 7.
4. The file type is not part of the COPY statement but must be type CBL.

EXAMPLE:

```
0041 DATA DIVISION.  
0042 COPY A:FILE6.  
0055 COPY A:FILE7.  
0105 COPY A:FILE8.
```

SECTION IV**PROCEDURE DIVISION****PROCEDURE DIVISION**

FUNCTION: To set forth the procedures to solve a given problem.

FORMAT:

PROCEDURE DIVISION
[USING data-name-1 [, data-name-2] ...].
[section-name SECTION [segment-number]].
paragraph-name.
 problem-solving statements.
paragraph-name.
 .
 .
 .
 problem-solving statements.
END PROGRAM program-name.

RULES:

1. The first entry in the PROCEDURE DIVISION must be a paragraph name, section-name or USING statement.
2. Each paragraph-name or section-name must be unique.
3. Each paragraph-name must be followed by a period.
4. Each problem-solving statement must be made up of reserved words, words previously described in a previous division, paragraph-names, figurative constants, numeric literals, non-numeric literals and/or punctuation marks.

EXAMPLE:

```
0100 PROCEDURE DIVISION.  
0101 BEGIN.  
0102     DISPLAY "HELLO".  
0103     STOP RUN.  
0104 END PROGRAM TEST1.
```

NOTE. The following pages are in alphabetical sequence by key word for easy reference.

ACCEPT**ACCEPT**

FUNCTION: To cause data to be made available to the specified data item via the console device.

FORMAT:

ACCEPT identifier

RULES:

1. The ACCEPT device is the console video typewriter.
2. Data is transferred from left to right until the receiving data item (identifier) is filled or until a carriage return is entered. The carriage return key is used to release the item and is not transferred to memory.
3. The delete key can be used to backspace if a mistake is made.
4. The backspace does not go past the beginning of the accept field.
5. In the CP/M mode using function 1 & 2 when the right end of a field is exceeded a "<" character notifies the user the last character was not entered into memory. This is done because CP/M automatically echo's the input character when it is keyed and it appears to the user as if it was processed internally when it was not. However, if the run time package is modified to use function 6 or direct BIOS then the characters exceeding the user field are not output to the screen.
6. See DISPLAY UNIT and the program CONFIG for details on setting up the CRT drivers.
7. The carriage return character is not echoed to the screen unless the CP/M function 1 & 2 mode is being used where CP/M automatically echo's it.

EXAMPLE:

```
0101 PROCEDURE DIVISION.  
0102 BEGIN.  
0103     ACCEPT EMPLOYEE-NAME (X1).  
0104     ACCEPT TODAYS-DATE.  
0105     DISPLAY "ENTER FILE NAME <D:FFFFFFF.EEE>".  
0105     ACCEPT THE-FILE-NAME.  
0106*  
0107*   clear the screen on a sol-20 next.  
0108     DISPLAY ""0B"".  
0109*   note screen-full can be 80*24=1920 size item.  
0110     DISPLAY SCREEN-FULL.  
0111*   set the cursor using a hexadecimal string.  
0112     DISPLAY ""1B,01,3F"".  
0113     ACCEPT INPUT-ITEM.
```

ADD**ADD**

FUNCTION: To add two numeric data items and to store the sum.

FORMAT:

```
{literal-1} {literal-2}
ADD {identifier-1} [TO] {identifier-2}
[GIVING identifier-3] [ROUNDED]
[, ON SIZE ERROR imperative-statement]
```

RULES:

1. Each ADD verb statement must contain an addend and an augend.
2. Figurative constants cannot be used.
3. Only numeric items and numeric literals can be used, except identifier-3 which can be an elementary numeric edited item.
4. The composite of operands must not contain more than 18 digits.
5. An identifier can only reference an elementary item.
6. Each operand can contain an operational sign and an implied decimal point.
7. Operands are aligned according to implied decimal points.
8. ROUNDED performs a test to see if right truncation will occur and, if it will, adjusts the result by adding 1 if the truncated digit is 5 or greater.
9. ON SIZE ERROR performs a test to see if overflow has occurred and, if it has, executes the imperative-statement.

EXAMPLE:

```
0150      ADD SALES-TAX TO TOTAL GIVING GRAND-TOTAL ROUNDED
0151          ON SIZE ERROR GO TO ERROR-ROUTINE.
```

ALTER**ALTER**

FUNCTION: To modify a predetermined sequence of operations.

FORMAT:

ALTER paragraph-name-1 TO PROCEED TO paragraph-name-2.

RULES:

1. Paragraph-name-1 must be the name of a paragraph which contains a single sentence consisting of:

GO TO paragraph-name.

2. The execution of the ALTER statement modifies the GO TO paragraph-name-1, so that subsequent executions of paragraph-name-1 transfer control to paragraph-name-2.

EXAMPLE:

```
0200 PARA-6. GO TO BEGIN.  
0201 PARA-7.  
0202     ALTER PARA-6 TO PROCEED TO END-OF-JOB.  
0203     GO TO PARA-6.  
0205 END-OF-JOB.
```

CALL**CALL**

FUNCTION: The CALL statement causes control to be transferred from one object program to another, within the run unit.

FORMAT:

```
        {literal-1    }
CALL {identifier-1}
        [USING data-name-1 [data-name-2]...]
```

RULES:

1. Literal-1 must be a nonnumeric literal.
2. Identifier-1 must be defined as an alphanumeric data item such that its value can be a program name.
3. The USING phrase is included in the CALL statement only if there is a USING phrase in the Procedure Division header of the called program and the number of operands in each USING phrase must be identical.
4. Each of the operands in the USING phrase must have been defined as a data item in the File Section or Working-Storage Section, and must have a level-number of 01 or 77.
5. The program whose name is specified by the value of literal-1 or identifier-1 is the called program; the program in which the call statement appears is the calling program.
6. The execution of a CALL statement causes control to pass to the called program.
7. A called program is in its initial state the first time it is called within a run unit and the first time it is called after a CANCEL to the called program. On all other entries into the called program, the state of the program remains unchanged from its state when last exited. This includes all data fields, the status and positioning of all files, and all alterable switch settings.
8. Called programs may contain call statements. However, a

called program must not contain a CALL statement that directly or indirectly calls the calling program.

9. The data-names, specified by the USING phrase of the CALL statement, indicate those data items available to a calling program that may be referred to in the called program. The order of appearance of the data-names in the USING phrase of the CALL statement and the USING phrase in the Procedure Division header is critical. Corresponding data-names refer to a single set of data which is available to the called and calling program. The correspondence is positional, not by name.

NEVADA COBOL details:

1. Called programs must be type .OBJ.
2. Each called program is dynamically loaded the first time and entered into a table in the run time package. Future calls go directly to the called program.
3. Up to 5 active called programs may be resident at any one time. At that point one will have to be CANCELled before any other can be loaded.
4. You can CALL another main program from the current program thus overlaying the first program. Since the working-storage section always begins at the same point in memory, those data-items not initialized with value statements will contain the information from the prior program. Be sure to CANCEL the program to remove it from the table as once the table is full and a program is called the job will terminate.
5. CALLED programs need not be COBOL programs. However, they must be type .OBJ and be ORGed correctly. The .OBJ file contains the machine language code for a program, the address at which the run time package is to load it, and the address at which execution of the loaded program is to begin. An .OBJ file consists of one or more segments that have the format:

#BYTES	DESCRIPTION
2	Number of code and data bytes in segment
2	Load address of code and data belonging to the segment.
Variable	Code and/or data.

The run time package will load each segment at the specified address until a starting address is encountered. A starting address is represented as load address with a zero byte count.

6. A program is supplied to convert CP/M HEX files to .OBJ format named CONVHEX.COM.

7. The run time package transfers control to the called program by means of an 8080 CALL instruction. The called program should return via the 8080 RET instruction. The called program should use its own stack not the COBOL stack.

8. Parameters are passed to the called program in the registers. H&L = parameter 1, D&E = parameter 2, B&C = either parameter 3 or the address of the left end of a list of parameter addresses if more than three parameters are passed. The parameters consist of 16-bit addresses pointing to the right end of each data-name.

9. In some cases it is possible to execute called programs without the calling program for testing when no data is being passed. Since the loading format is the same for all type .OBJ programs, you can A>RUN NEXTPROG

EXAMPLE:

```
0001    CALL "NEXTPROG" USING REC-1, REC-2.  
0555    CALL NEXT-PROG USING REC-1, REC-2.  
*  
* also see complete programs at end of manual.
```

CANCEL**CANCEL**

FUNCTION: The CANCEL statement releases the memory areas occupied by the referred to program.

FORMAT:

{literal-1 }
CANCEL {identifier-1}

RULES:

1. Subsequent to the execution of a CANCEL statement, the program referred to therein ceases to have any logical relationship to the run unit in which the CANCEL statement appears. A subsequently executed CALL statement naming the same program will result in that program being initiated in its initial state. The memory areas associated with the named programs are released so as to be made available for disposition by the operating system.
2. A program named in the CANCEL statement must not refer to any program that has been called and has not yet executed an EXIT PROGRAM statement.
3. A logical relationship to a cancelled subprogram is established only by execution of a subsequent CALL statement.
4. A called program is cancelled either by being referred to as the operand of a CANCEL statement or by the termination of the run unit of which the program is a member.
5. No action is taken when a CANCEL statement is executed naming a program that has not been called in this unit or has been called and is at present cancelled. Control passes to the next statement.

EXAMPLE:

```
0001      CANCEL "LASTPROG".  
0555      CANCEL LAST-PROG.  
* also see complete programs at end of manual.
```

CLOSE**CLOSE**

FUNCTION: To terminate the processing of input and output files.

FORMAT:

CLOSE file-name

RULES:

1. A file must be opened before it can be closed.
2. If required, the CLOSE statement writes the final block with padding before closing the file.

EXAMPLE:

```
0300 END-OF-JOB.  
0301      CLOSE NEW-PAYROLL-MASTER-FILE.  
0302      CLOSE OLD-PAYROLL-MASTER-FILE.  
0303      CLOSE LISTING.
```

COPY**COPY**

FUNCTION: The COPY statement inserts text into the source program at compile time.

FORMAT:

COPY u:file-name .

RULES:

1. A COPY cannot occur within another COPY.
2. The disk unit (u:) is optional and if not present the default drive will be used.
3. The COPY statement should be preceded by a space and terminated by a period, normally, starting in column 7.
4. The file type is not part of the COPY statement but must be type CBL.

EXAMPLE:

```
0100 PROCEDURE DIVISION.  
0101 PARAGRAPH-A.  
0102   COPY A:FILEA.  
2500 PARAGRAPH-B.  
2501   COPY A:FILEB.  
3500 PARAGRAPH-C.  
3501   COPY B:FILEC.
```

DISPLAY**DISPLAY**

FUNCTION: To display data on the video typewriter.

FORMAT-1:

{literal-1 } {literal-2 }
DISPLAY {identifier-1} [{identifier-2}] ...
[WITH NO ADVANCING]

FORMAT-2:

{literal-3 }
DISPLAY UNIT {identifier-3}.

RULES:

1. The DISPLAY device is the console video typewriter.
2. If the literal is a numeric literal, then it must not be signed as the sign would be displayed as a lower case letter.
3. A carriage return & line feed are executed before data transfer begins unless WITH NO ADVANCING is specified.
4. Data is transferred from left to right until all of the data in literal or identifier-1 is transferred.
5. If data is longer than 64 or 80 characters as set by the CONFIG program, the video display will continue on the next line. In this way the entire screen can be filled with one DISPLAY statement.
6. Each literal may be any figurative constant, except ALL.
7. If a figurative constant is specified as one of the operands, only a single occurrence of the figurative constant is displayed.
8. The DISPLAY statement causes the contents of each operand to be transferred to the hardware device in the order listed.

9. The DISPLAY UNIT literal changes the I-O driver at run time as follows:

"0X" skips CP/M and uses the BIOS driver.

"2X" uses CP/M function 1 & 2 drivers.

"6X" uses CP/M 2.X function 6 drivers.

X will allow any character to be input any other character in this position will allow only ASCII input. All of these changes are temporary.

10. To permanently change the run time package drivers read the instructions for the program CONFIG.

11. UNIT 0 or UNIT 6 must be used if sending or receiving characters other than ASCII, such as video control characters. This is because CP/M monitors function 1 and 2 and will not allow certain control characters to pass too and from the user.

EXAMPLE:

```
0350 ERROR-ROUTINE.  
0351   DISPLAY ERROR-MESSAGE (ERROR-CODE).  
0352   DISPLAY FIRST-NAME, LAST-NAME, "NAME ".  
0359D  DISPLAY "DEBUG MODE ERROR ROUTINE".  
0360   DISPLAY "CONTINUE ON SAME LINE" WITH NO ADVANCING.  
0370* the next line clears the screen on a Sol-20 or VDM-1  
0380   DISPLAY ""0B"".  
0391* the next line clears the screen on Hazeltine-1520  
0392   DISPLAY ""7E,1C"".  
0390* each CRT is different but if you know the commands you  
0391* can also set the cursor and display in reverse.  
0391* the next line sets the I-O driver for BIOS any  
0391* incoming character will be passed to user.  
0392   DISPLAY UNIT "0X".  
0500* the following sequence is a common debugging method.  
0501 PARAGRAPH-A.  
0502* line 0505 is a debugging line used when testing  
0503* to let the programmer know that the paragraph has been  
0504* executed  
0505D  DISPLAY "PARAGRAPH-A".
```

DIVIDE**DIVIDE**

FUNCTION: To divide one numerical data item into another and set the value of an item equal to the quotient.

FORMAT:

```
DIVIDE {identifier-1} INTO {identifier-2}  
[GIVING identifier-3]  
[ROUNDED] [, ON SIZE ERROR imperative-statement]
```

RULES:

1. Each DIVIDE statement must contain a dividend and a divisor.
2. Each identifier must refer to an elementary numeric item, except the identifier-3 which may be an elementary numeric edited item.
3. The composite of operands must not contain more than 18 digits.
4. An identifier can only reference an elementary item.
5. Each operand can contain an operational sign and an implied decimal point.
6. Operands are aligned according to implied decimal points.
7. ROUNDED performs a test to see if right truncation will occur and, if it will, adjusts the result by adding 1 if the truncated digit is 5 or greater.
8. ON SIZE ERROR performs a test to see if overflow has occurred and, if it has, executes the imperative-statement.

EXAMPLE:

```
0400 CALC-1.  
0401      DIVIDE HOURS INTO GROSS-PAY GIVING HOURLY-RATE  
0402          ROUNDED ON SIZE ERROR GO TO ERR-2.  
0403      DIVIDE HOURS INTO MILES.
```

END PROGRAM**END PROGRAM**

FUNCTION: To signal the physical end of the program.

FORMAT:

END PROGRAM program-name

RULES:

1. This entry must be the last physical statement in every source program.
2. This is a Compiler Directing statement that tells the Compiler it is the last statement in the COBOL source program file to be processed.

EXAMPLE:

* all program statements must be above
9999 END PROGRAM TEST1.

EXIT**EXIT**

FUNCTION: To furnish an end point for a series of procedures.

FORMAT-1:

EXIT.

FORMAT-2:

EXIT PROGRAM.

RULES:

1. The EXIT statement must appear in a sentence by itself, and be the only sentence in the paragraph.
2. An execution of an EXIT PROGRAM statement in a called program causes control to be passed to the calling program. Execution of an EXIT PROGRAM statement in a program which is not called behaves as if the statement were an EXIT statement.

EXAMPLE:

```
0500 PARA-END.  
0501      EXIT.  
0600 END-SUBPROGRAM.  
0601      EXIT PROGRAM.
```

GO TO**GO TO**

FUNCTION: To depart from the normal sequence of procedures.

FORMAT-1:

GO TO procedure-name-1

FORMAT-2:

GO TO procedure-name-1, [procedure-name-2]...
DEPENDING ON identifier.

RULES:

1. The GO TO statement must be the last statement in a sequence.
2. Identifier is the name of a numeric elementary item described without any positions to the right of the assumed decimal point.
3. When a paragraph is referenced by an ALTER statement, that paragraph can consist only of a paragraph header followed by a format-1 GO TO statement.
4. When a GO TO statement, represented by format-1 is executed, control is transferred to procedure-name-1 or to another procedure-name if the GO TO statement has been modified by an ALTER statement.
5. When a GO TO statement represented by format-2 is executed, control is transferred to procedure-name-1, procedure-name-2, etc., depending on the value of the identifier being 1, 2,..., n. If the value of the identifier is anything other than the positive or unsigned integers 1, 2, ..., n, then no transfer occurs and control passes to the next statement in the normal sequence for execution.

EXAMPLE:

```
0330    IF A-SWITCH IS EQUAL TO 1
0331        MOVE X-AMT TO Y-AMT
0332        GO TO A-SUBROUTINE.
0333        GO TO MAIN-PROGRAM.
0334 CASE-STATEMENT-PARA.
0335        GO TO A-PARA, B-PARA, C-PARA DEPENDING ON X1.
0336 ALTERED-PARA.
0337        GO TO FIRST-PARA.
```

IF**IF**

FUNCTION: The IF statement causes a condition to be evaluated. The subsequent action of the object program depends on whether the value of the condition is true or false.

FORMAT-1:

```
IF {condition} {NEXT SENTENCE} {ELSE NEXT SENTENCE}
```

{condition}:

```
{ = < > }  
{ EQUAL TO }  
identifier-1 IS [NOT] {LESS THAN } {literal }  
{GREATER THAN} {identifier-2}
```

{condition}:

```
identifier-3 IS [NOT] {NUMERIC }  
{ALPHABETIC}
```

FORMAT-2:

```
IF condition {OR }  
{AND} condition
```

RULES:

1. Statement-1 and statement-2 represent an imperative statement.
2. Non-numeric comparisons are made left to right using the ASCII collating sequence.
3. Numeric comparisons are made by aligning the decimal points and treating them as algebraic quantities.
4. Identifier-3 must be a DISPLAY (ASCII) data type.
5. If the condition is true, statement-1 is executed if specified. If statement-1 contains a procedure branching statement, control is explicitly transferred in accordance with the rules of that statement. If statement-1 does not

contain a procedure branching statement, the ELSE phrase, if specified, is ignored and control passes to the next executable sentence.

6. The ELSE NEXT SENTENCE phrase may be omitted if it immediately precedes the terminal period of the sentence.

7. If the condition is true and the NEXT SENTENCE phrase is specified instead of statement-1, the ELSE phrase, if specified, is ignored and control passes to the next executable sentence.

8. If the condition is false, statement-1 or its surrogate NEXT SENTENCE is ignored, and statement-2, if specified, is executed. If statement-2 contains a procedure branching statement, control is explicitly transferred in accordance with the rules of that statement. If statement-2 does not contain a procedure branching statement, control passes to the next executable sentence. If the ELSE statement-2 is not specified, statement-1 is ignored and control passes to the next executable sentence.

9. If the condition is false, and the ELSE NEXT SENTENCE phrase is specified, statement-1 is ignored, if specified, and control passes to the next executable sentence.

10. Two conditions can be combined by the logical operators AND and OR.

EXAMPLE:

```
0340      IF LAST-NAME IS NOT ALPHABETIC
0341          MOVE ERR-CODE TO MESG
0342          ADD 1 TO ERR-COUNT
0343          GO TO KEY-PUNCH-ERROR
0344      ELSE
0345          PERFORM A-PARA THRU B-PARA.
0346      IF HOURLY-RATE < 3.90 AND FRINGE-BENEFITS < 6000
0347          GO TO MIN-WAGE-ERROR.
0348      IF A = B
0349          OR = C
0350          OR = D
0351          OR X NOT > Y
0352          MOVE S TO W
0353      ELSE
0354          MOVE S TO AW.
```

INSPECT**INSPECT**

FUNCTION: The INSPECT statement provides the ability to tally, replace, or tally and replace occurrences of single characters in a data item.

FORMAT-1

```
INSPECT identifier-1 TALLYING
    {ALL {literal-1}}
    {LEADING {identifier-3}}
{identifier-2 FOR {{CHARACTERS}}}
    [{AFTER} {literal-2}]
    [{BEFORE} INITIAL {identifier-4}]}...}...
```

FORMAT-2

```
INSPECT identifier-1 REPLACING
    {literal-4}
{{CHARACTERS BY {identifier-6}}}
    [{AFTER} {literal-5}]
    [{BEFORE} INITIAL {identifier-7}]
{ALL}
{FIRST} {literal-3} {literal-4}
{LEADING} {{identifier-5} BY {identifier-6}}
    [{AFTER} {literal-5}]
    [{BEFORE} INITIAL {identifier-7}]
```

FORMAT-3

```
INSPECT identifier-1 TALLYING
    {ALL {literal-1}}
    {LEADING {identifier-3}}
{identifier-2 FOR {{CHARACTERS}}}
    [{AFTER} {literal-2}]
    [{BEFORE} INITIAL {identifier-4}]}...}...
```

REPLACING

```
{literal-4}
{{CHARACTERS BY {identifier-6}}}
    [{AFTER} {literal-5}]
    [{BEFORE} INITIAL {identifier-7}]
{ALL}
{FIRST} {literal-3} {literal-4}
{LEADING} {{identifier-5} BY {identifier-6}}
    [{AFTER} {literal-5}]
    [{BEFORE} INITIAL {identifier-7}]
```

RULES:

1. Identifier-1 must reference either a group item or any category of elementary item, described (either implicitly or explicitly) as usage is DISPLAY.
2. Identifier-3... identifier-n must reference either an elementary alphabetic, alphanumeric or numeric item described (either implicitly or explicitly) as usage is DISPLAY.
3. Each literal must be nonnumeric and may be any figurative constant, except ALL.
4. Literal-1, 2, 3, 4, 5 and the data items referenced by identifier-3, 4, 5, 6, and 7 must be one character in length.

FORMATS 1 and 3 only

5. Identifier-2 must reference an elementary numeric data item.
6. If either literal-1 or literal-2 is a figurative constant, the figurative constant refers to an implicit one character data item.

FORMATS 2 and 3 only

7. The size of the data referenced by literal-4 or identifier-6 must be equal to the size of the data referenced by literal-3 or identifier-5. When a figurative constant is used as literal-4, the size of the figurative constant is equal to the size of literal-3 or the size of the data item referenced by identifier-5.

8. When the CHARACTERS phrase is used, literal-4, literal-5 or the size of the data item referenced by identifier-6, identifier-7 must be one character in length.

9. When a figurative constant is used as literal-3, the data referenced by literal-4 or identifier-6 must be one character in length.

GENERAL RULES:

1. Inspection (which includes the comparison cycle, the establishment of boundaries for the BEFORE or AFTER phrase, and the mechanism for tallying and/or replacing) begins at the leftmost character position of the data item referenced by identifier-1, regardless of its class, and proceeds from left to right to the rightmost character position as described in general rules 4 through 6.

2. For use in the INSPECT statement, the contents of the data item referenced by identifier-1, 3, 4, 5, 6 or 7 will be treated as follows:

a. If any of identifier-1, 3, 4, 5, 6 or 7 are described as alphanumeric, the INSPECT statement treats the contents of each such identifier as a character-string.

b. If any of identifier-1, 3, 4, 5, 6 or 7 are described as alphanumeric edited, numeric edited or unsigned numeric, the data item is inspected as though it had been redefined as alphanumeric and the INSPECT statement had been written to reference the redefined data item.

c. If any of identifier-1, 3, 4, 5, 6 or 7 are described as signed numeric, the data item is inspected as though it had been moved to an unsigned numeric data item of the same length and then the rules in general rule 2b had been applied.

3. In general rules 4 through 11 all references to literal-1, 2, 3, 4 and 5 apply equally to the contents of the data item referenced by identifier-3, 4, 5, 6 and 7, respectively.

4. During inspection of the contents of the data item referenced by identifier-1, each properly matched occurrence of literal-1 is tallied (formats 1 and 3) and/or each properly matched occurrence of literal-3 is replaced by literal-4 (formats 2 and 3).

5. The comparison operation to determine the occurrences of literal-1 to be tallied and/or occurrences of literal-3 to be replaced, occurs as follows:

a. The operands of the TALLYING and REPLACING phrases are considered in the order they are specified in the INSPECT statement from left to right. The first literal-1, literal-3 is compared to an equal number of contiguous characters, starting with the leftmost character position in the data item referenced by identifier-1. Literal-1, literal-3 and that portion of the contents of the data item referenced by identifier-1 match if, and only if, they are equal, character for character.

b. If no match occurs in the comparison of the first literal-1, literal-3, the comparison is repeated with each successive literal-1, literal-3, if any until either a match is found or there is no next successive literal-1, literal-3. When there is no next successive literal-1, literal-3, the character position in the data item

referenced by identifier-1 immediately to the right of the leftmost character position considered in the last comparison cycle is considered as the leftmost character position, and the comparison cycle begins again with the first literal-1, literal-3.

c. Whenever a match occurs, tallying and/or replacing takes place as described in general rules 8 through 10. The character position in the data item referenced by identifier-1 immediately to the right of the rightmost character position that participated in the match is now considered to be the leftmost character position of the data item referenced by identifier-1, and the comparison cycle starts again with the first literal-1, literal-3.

d. The comparison operation continues until the rightmost character position of the data item referenced by identifier-1 has participated in a match or has been considered as the leftmost character position. When this occurs, inspection is terminated.

e. If the CHARACTERS phrase is specified, an implied one character operand participates in the cycle described in paragraphs 5a through 5d above, except than no comparison to the contents of the data item referenced by identifier-1 takes place. This implied character is considered always to match the leftmost character of the contents of the data item referenced by identifier-1 participating in the current comparison cycle.

6. The comparison operation defined in general rule 5 is affected by the BEFORE and AFTER phrases as follows:

a. If the BEFORE or AFTER phrase is not specified, literal-1, literal-3 or the implied operand of the CHARACTERS phrase participates in the comparison operation as described in general rule 5.

b. If the BEFORE phrase is specified, the associated literal-1, literal-3 or the implied operand of the CHARACTERS phrase participates only in those comparison cycles which involve that portion of the contents of the data item referenced by identifier-1 from its leftmost character position up to, but not including, the first occurrence of literal-2, literal-5 within the contents of the data item referenced by identifier-1. The position of this first occurrence is determined before the first cycle of the comparison operation described in general rule 5 is begun. If, on any comparison cycle, literal-1, literal-3 or the implied operand of the CHARACTERS phrase is not eligible to participate, it is considered not to match the contents of the data item referenced by identifier-1. If there is no

occurrence of literal-2, literal-5 within the contents of the data item referenced by identifier-1, its associated literal-1, literal-3, or the implied operand of the CHARACTERS phrase participates in the comparison operation as though the BEFORE phrase had not been specified.

c. If the AFTER phrase is specified, the associated literal-1, literal-3 or the implied operand of the CHARACTERS phrase may participate only in those comparison cycles which involve that portion of the contents of the data item referenced by identifier-1 from the character position immediately to the right of the rightmost character position of the first occurrence of literal-2, literal-5 within the contents of the data item referenced by identifier-1 and the rightmost character position of the data item referenced by identifier-1. The position of this first occurrence is determined before the first cycle of the comparison operation described in general rule 5 is begun. If, on any comparison cycle, literal-1, literal-3 or the implied operand of the CHARACTERS phrase is not eligible to participate, it is considered not to match the contents of the data item referenced by identifier-1. If there is no occurrence of literal-1, literal-5 within the contents of the data item referenced by identifier-1, its associated literal-1, literal-3, or the implied operand of the CHARACTERS phrase is never eligible to participate in the comparison operation.

FORMAT 1

7. The contents of the data item referenced by identifier-2 is not initialized by the execution of the INSPECT statement.

8. The rules for tallying are as follows:

a. If the ALL phrase is specified, the contents of the data item referenced by identifier-2 is incremented by one (1) for each occurrence of literal-1 matched within the contents of the data item referenced by identifier-1.

b. If the LEADING phrase is specified, the contents of the data item referenced by identifier-2 is incremented by one (1) for each contiguous (adjacent) occurrence of literal-1 matched within the contents of the data item referenced by identifier-1, provided that the leftmost such occurrence is at the point where comparison began in the first comparison cycle in which literal-1 was eligible to participate.

c. If the CHARACTERS phrase is specified, the contents of the data item referenced by identifier-2 is incremented by one (1) for each character matched, in the sense of general rule 5e, within the contents of the data item referenced by

identifier-1.

FORMAT 2

9. The required words ALL, LEADING, and FIRST are adjectives.

10. The rules for replacement are as follows:

a. When the CHARACTERS phrase is specified, each character matched, in the sense of general rule 5e, in the contents of the data item referenced by identifier-1 is replaced by literal-4.

b. When the adjective ALL is specified, each occurrence of literal-3 matched in the contents of the data item referenced by identifier-1 is replaced by literal-4.

c. When the adjective LEADING is specified, each contiguous occurrence of literal-3 matched in the contents of the data item referenced by identifier-1 is replaced by literal-4, provided that the leftmost occurrence is at the point where comparison began in the first comparison cycle in which literal-3 was eligible to participate.

d. When the adjective FIRST is specified, the leftmost occurrence of literal-3 matched within the contents of the data item referenced by identifier-1 is replaced by literal-4.

FORMAT 3

11. A format 3 INSPECT statement is interpreted and executed as though two successive INSPECT statements specifying the same identifier-1 had been written with one statement being a format 1 statement with TALLYING phrases identical to those specified in the format 3 statement, and the other statement being a format 2 statement with REPLACING phrases identical to those specified in the format 3 statement. The general rules given for matching and counting apply to the format 1 statement and the general rules given for matching and replacing apply to the format 2 statement.

EXAMPLES:

Following are six examples of the INSPECT statement:

INSPECT word TALLYING count FOR LEADING "L" BEFORE INITIAL "A", count-l FOR LEADING "A" BEFORE INITIAL "L".

Where word = LARGE, count = 1, count-l = 0.

Where word = ANALYST, count = 0, count-l = 1.

INSPECT word TALLYING count FOR ALL "L", REPLACING LEADING "A" BY "E" AFTER INITIAL "L".

Where word = CALLAR, count = 2, word = CALLAR.

Where word = SALAMI, count = 1, word = SALEMI.

Where word = LATTER, count = 1, word = LETTER.

INSPECT word REPLACING ALL "A" BY "G" BEFORE INITIAL "X".

Where word = ARXAX, word = GRXAX.

Where word = HANDAX, word = HGNDGX.

INSPECT word TALLYING count FOR CHARACTERS AFTER INITIAL "J"
REPLACING ALL "A" BY "B".

Where word = ADJECTIVE, count = 6, word = BDJECTIVE.

Where word = JACK, count = 3, word = JBCCK.

Where word = JUJMAB, count = 5, word = JUJMBB.

INSPECT word REPLACING ALL "X" BY "Y" "B" BY "Z" "W" BY
"Q" AFTER INITIAL "R".

Where word = RXXBQWY, word = RYYZQQY.

Where word = YZACDWBR, word = RAQRYEZ.

INSPECT word REPLACING CHARACTERS BY "B" BEFORE INITIAL "A".

word before: 12 XZABCD

word after: BBBBABC

MOVE**MOVE**

FUNCTION: To transfer data from one data area to another.

FORMAT:

```
{literal-1 }  
MOVE {identifier-1} TO identifier-2 [identifier-3]...
```

RULES:

1. Identifier-1 and literal-1 represent the sending area and identifier-2 identifier-3, ..., represent the receiving area.
2. The data designated by the literal-1 or identifier-1 is moved first to identifier-2, then to identifier-3, The rules referring to identifier-2 also apply to the other receiving areas. Any subscripting associated with identifier-2, ..., is evaluated immediately before the data is moved to the receiving data item.
3. Any MOVE in which the sending and receiving items are both elementary items is an elementary move. Every elementary item belongs to one of the following categories: numeric, alphabetic, alphanumeric, numeric edited, alphanumeric edited. These categories are described in the PICTURE clause. Numeric literals belong to the category numeric, and nonnumeric literals belong to the category alphanumeric. The figurative constant ZERO belongs to the category numeric. The figurative constant SPACE belongs to the category alphabetic. All other figurative constants belong to the category alphanumeric.

The following rules apply to an elementary move between these categories:

- a. The figurative constant SPACE, a numeric edited, alphanumeric edited, or alphabetic data item must not be moved to a numeric or numeric edited data item.
- b. A numeric literal, the figurative constant ZERO, a numeric data item or a numeric edited data item must not be moved to an alphabetic data item.
- c. A non-integer numeric literal or a non-integer numeric data item must not be moved to an alphanumeric or alphanumeric edited data item.

d. All other elementary moves are legal and are performed according to the rules given in general rule 4.

4. Any necessary conversion of data from one form of internal representation to another takes place during legal elementary moves, along with any editing specified for the receiving data item:

a. When an alphanumeric edited or alphanumeric item is a receiving item, alignment and any necessary space filling takes place. If the size of the sending item is greater than the size of the receiving item, the excess characters are truncated on the right after the receiving item is filled. If the sending item is described as being signed numeric, the operational sign will not be moved; if the operational sign occupied a separate character position, that character will not be moved and the size of the sending item will be considered to be one less than its actual size (in terms of standard data format characters).

b. When a numeric or numeric edited item is the receiving item, alignment by decimal point and any necessary zero-filling takes place as necessary, except where zeroes are replacing because of editing requirements.

1. When a signed numeric item is the receiving item, the sign of the sending item is placed in the receiving item. Conversion of the representation of the sign takes place as necessary. If the sending item is unsigned, a positive sign is generated for the receiving item.

2. When an unsigned numeric item is the receiving item, the absolute value of the sending item is moved and no operational sign is generated for the receiving item.

3. When a data item described as alphanumeric is the sending item, data is moved as if the sending item were described as an unsigned numeric integer.

c. When a receiving field is described as alphabetic, justification and any necessary space-filling takes place as defined. If the size of the sending item is greater than the size of the receiving item, the excess characters are truncated on the right after the receiving item is filled.

5. Any move that is not an elementary move is treated exactly as if it were an alphanumeric to alphanumeric elementary move, except that there is no conversion of data from one form of internal representation to another. In such a move, the receiving area will be filled without consideration for the individual elementary or group items contained within either the sending or receiving area, except as noted in the OCCURS clause.

6. If literal-1 is SPACE, QUOTE or ZERO then identifier-2 is

entirely filled with the figurative constant.

7. In a non-numeric move the data is moved left to right.

EXAMPLE:

```
0360 MAIN-MOVE-ROUTINE.  
0361     MOVE SPACES TO PRINT-LINE.  
0362     MOVE FIRST-NAME TO P-FIRST-NAME.  
0363     MOVE LAST-NAME TO P-LAST-NAME.  
0364     MOVE ORDER (W-INDEX) TO P-ORDER.  
0365     MOVE ZEROS TO AMT-1, AMT-2, AMOUNT-3.  
0366     MOVE SPACES TO FIRST-NAME  LAST-NAME.
```

MULTIPLY**MULTIPLY**

FUNCTION: To multiply numeric data items and set the value of an item equal to the result.

FORMAT:

```
MULTIPLY {literal-1} {literal-2}
{identifier-1} BY {identifier-2}
[GIVING identifier-3] [ROUNDED]
[, ON SIZE ERROR imperative-statement]
```

RULES:

1. Each identifier must be a elementary numeric item, except identifier-3 which may be a elementary numeric edited item.
2. Each literal must be a numeric literal.
3. The resultant product must not contain more than 18 digits.
4. An identifier can only reference an elementary item.
5. Each operand can contain an operational sign and an implied decimal point.
6. Operands are aligned according to implied decimal points.
7. ROUNDED performs a test to see if right truncation will occur and, if it will, adjusts the result by adding 1 if the truncated digit is 5 or greater.
8. ON SIZE ERROR performs a test to see if overflow has occurred and, if it has, executes the imperative-statement.

EXAMPLE:

```
0399 CALCULATION-ROUTINE.
0400      MULTIPLY WAGE-RATE BY REGULAR-HRS GIVING
0401          GROSS-PAY ROUNDED ON SIZE ERROR GO TO P-ERR.
0402      MULTIPLY WAGE-RATE BY OVERTIME-HOURS.
```

OPEN**OPEN**

FUNCTION: To initiate the processing of both input and output files.

FORMAT:

```
{I-O      }
{INPUT    }
OPEN {OUTPUT} file-name
```

RULES:

1. A file must be opened before it can be read, written or closed.
2. The OPEN statement does not cause a data transfer to or from the file.
3. In the output SEQUENTIAL ACCESS mode, if the file does not exist it is created.
4. In the RANDOM ACCESS mode, the file must already exist.
5. The I-O (INPUT-OUTPUT) option applies to DISK files only.

EXAMPLE:

```
0700 BEGIN.
0701      OPEN OUTPUT NEW-PAYROLL-MASTER-FILE.
0702      OPEN INPUT OLD-PAYROLL-MASTER-FILE.
0703      OPEN OUTPUT LISTING.
```

PERFORM**PERFORM**

FUNCTION: To depart from the normal sequence of procedures in order to execute one statement, or a sequence of statements, and then return to the normal sequence.

FORMAT 1:

PERFORM procedure-name-1 [{THRU}] procedure-name-2

FORMAT 2:

PERFORM procedure-name-1 [{THRU}] procedure-name-2
 {integer-1 }
 {identifier-1} TIMES

FORMAT 3:

PERFORM procedure-name-1 [{THRU}] procedure-name-2
 {OR }
 UNTIL condition-1 {AND} condition-2

RULES:

1. Each identifier represents a numeric elementary item described in the Data Division. In format 2, identifier-1 must be described as a numeric integer.

2. The words THRU and THROUGH are equivalent.

3. When the PERFORM statement is executed, control is transferred to the first statement of the procedure named procedure-name-1. This transfer of control occurs only once for each execution of a PERFORM statement. For those cases where a transfer of control to the named procedure does take place, an implicit transfer of control to the next executable statement following the PERFORM statement is established as follows:

a. If procedure-name-1 is a paragraph-name and procedure-name-2 is not specified, then the return is after the last statement of procedure-name-1.

b. If procedure-name-1 is a section-name and procedure-name-2 is not specified, then the return is after the last statement of the last paragraph in

procedure-name-1.

c. If procedure-name-2 is specified and it is a paragraph-name, then the return is after the last statement of the paragraph.

d. If procedure-name-2 is specified and it is a section-name, then the return is after the last statement of the last paragraph in the section.

4. There is no necessary relationship between procedure-name-1 and procedure-name-2 except that a consecutive sequence of operations is to be executed beginning at the procedure named procedure-name-1 and ending with the execution of the procedure named procedure-name-2. In particular, GO TO and PERFORM statements may occur between procedure-name-1 and the end of procedure-name-2. If there are two or more logical paths to the return point, then procedure-name-2 may be the name of a paragraph consisting of the EXIT statement, to which all of these paths must lead.

5. If control passes to these procedures by means other than a PERFORM statement, control will pass through the last statement of the procedure to the next executable statement as if no PERFORM statement mentioned these procedures.

6. The PERFORM statements operate as follows with rule 5 above applying to all formats:

a. Format 1 is the basic PERFORM statement. A procedure referenced by this type of PERFORM statement is executed once and then control passes to the next executable statement following the PERFORM statement.

b. Format 2 is the PERFORM...TIMES. The procedures are performed the number of times specified by integer-1 or by the initial value of the data item referenced by identifier-1 for that execution. If, at the time of execution of a PERFORM statement, the value of the data item referenced by identifier-1 is equal to zero or is negative, control passes to the next executable statement following the PERFORM statement. Following the execution of the procedures the specified number of times, control is transferred to the next executable statement following the PERFORM statement.

During execution of the PERFORM statement, references to identifier-1 cannot alter the number of times the procedures are to be executed from that which was indicated by the initial value of identifier-1.

c. Format 3 is the PERFORM...UNTIL. The specified procedures are performed until the condition specified by

the UNTIL phrase is true. When the condition is true, control is transferred to the next executable statement after the PERFORM statement. If the condition is true when the PERFORM statement is entered, no transfer to procedure-name-1 takes place, and control is passed to the next executable statement following the PERFORM statement.

7. If a sequence of statements referred to by a PERFORM statement includes another PERFORM statement, the sequence of procedures associated with the included PERFORM must itself either be totally included in, or totally excluded from, the logical sequence referred to by the first PERFORM. Thus, an active PERFORM statement, whose execution point begins within the range of another PERFORM statement, must not allow control to pass to the exit of the other active PERFORM statement; furthermore, two or more such active PERFORM statements may not have a common exit.

8. A PERFORM statement that appears in a section that is not in an independent segment can have within its range, in addition to any declarative sections whose execution is caused within that range, only one of the following:

- a. Sections and/or paragraphs wholly contained in one or more non-independent segments.
- b. Sections and/or paragraphs wholly contained in a single independent segment.

9. A PERFORM statement that appears in an independent segment can have within its range, in addition to any declarative sections whose execution is caused within that range, only one of the following:

- a. Sections and/or paragraphs wholly contained in one or more non-independent segments.
- b. Sections and/or paragraphs wholly contained in the same independent segment as the PERFORM statement.

EXAMPLE:

```
0750      PERFORM CALCULATE-PAY THRU PARA-END.  
0751      PERFORM MAIN-PROGRAM.  
0791      PERFORM CHECK-ROUTINE 5 TIMES.  
0799      PERFORM TEST-ROUTINE UNTIL CODE-1 > T-CODE.  
0800      PERFORM PARA-1 THRU PARA-2  
0801          UNTIL A = B OR X=Y AND Z=W.
```

READ**READ**

FUNCTION: To make available the next logical record from an open file.

FORMAT:

READ file-name RECORD {AT END } {INVALID KEY} imperative-statement

RULES:

1. A file must be OPENed before it can be read.
2. The AT END statement must be used for SEQUENTIAL files and is executed at the end of the file.
3. The INVALID KEY statement must be used with RANDOM files and if executed the data in the user area is unspecified.
4. The number of the requested record in a RANDOM file must be placed in the RELATIVE KEY before the READ statement is executed.
5. When reading variable length delimited files the record area should be cleared to spaces before each read because the data in the user record area to the right of the last valid character of the input item is unspecified i.e., whatever data was there from before the read will be there.
6. When reading variable length delimited files the TAB (09H) characters created by some text editors are not expanded to avoid conflict with packed decimal (COMP-3) data type. If tab characters are used they can be expanded by CP/M's PIP command using the "T" option before processing by COBOL programs.

EXAMPLE:

```
0800 READ-ROUTINE.  
0801      MOVE SPACES TO PAYROLL-RECORD.  
0802      READ OLD-PAYROLL-MASTER-FILE  
0803          AT END GO TO OLD-E0J-ROUTINE.  
0900 READ-RANDOM.  
* if you wanted record 100 in a random file  
0901      MOVE 100 TO KEY3-RECORD-NUMBER.  
0902      READ IN-RANDOM-FILE  
0903          INVALID KEY DISPLAY "INVALID KEY".
```

REWRITE**REWRITE**

FUNCTION: To replace a record existing in a disk file.

FORMAT:

REWRITE record-name [INVALID KEY imperative-statement]

RULES:

1. The file must have been opened in the I-O mode.
2. The record-name must be the name of a logical record in the FILE SECTION of the DATA DIVISION.
3. The REWRITE statement must have been preceeded by a successful READ statement in the SEQUENTIAL ACCESS MODE as it is this logical record that is replaced.
4. The INVALID KEY clause must be used for RANDOM files.
5. For files accessed in RANDOM access mode the record logically replaces the record specified by the contents of the RELATIVE KEY data item associated with the file.

EXAMPLE:

```
* in-file is the file name and in-rec is a record name
* for the file
0097 SEQ-REWRITE.
0098     READ IN-FILE RECORD AT END GO TO EOJ.
0099     MOVE NEW-DATA TO IN-REC.
0100     REWRITE IN-REC.
0200 RANDOM-REWRITE.
0201     MOVE 100 TO KEY-REL.
0202     REWRITE NEW-REC INVALID KEY GO TO ERROR.
```

STOP**STOP**

FUNCTION: To cause permanent or temporary suspension of the execution of the object program.

FORMAT:

STOP {RUN }
 {literal}

RULES:

1. All files should be closed before a STOP RUN statement is issued.
2. The STOP RUN statement must be the last statement executed in the program as the operating system takes control after execution.
3. The literal is displayed on the console device and waits for a code followed by a carriage return to be entered as follows:

C <CR>= continue
E <CR>= exit to operating system.

EXAMPLE:

0900 END-OF-JOB. STOP RUN.
0500 ERR. STOP "SIZE ERROR ENTER C TO CONTINUE".

SUBTRACT**SUBTRACT**

FUNCTION: To subtract one numeric data item from another and set the value of an item equal to the result.

FORMAT:

```
SUBTRACT {literal-1}      {literal-2}
          {identifier-1} FROM {identifier-2}

          [GIVING identifier-3] [ROUNDED]

          [, ON SIZE ERROR imperative-statement]
```

RULES:

1. Each identifier must refer to a elementary numeric item, except identifier-3 which may refer to a elementary numeric edited item.
2. The composite of operands must not contain more than 18 digits.
3. An identifier can only reference an elementary item.
4. Each operand can contain an operational sign and an implied decimal point.
5. Operands are aligned according to implied decimal points.
6. ROUNDED performs a test to see if right truncation will occur and, if it will, adjusts the result by adding 1 if the truncated digit is 5 or greater.
7. ON SIZE ERROR performs a test to see if overflow has occurred and, if it has, executes the imperative-statement.

EXAMPLE:

```
0870      SUBTRACT TAXES FROM GROSS-PAY GIVING NET-PAY
0871          ROUNDED ON SIZE ERROR GO TO TAX-ERR-ROUTINE.
```

WRITE**WRITE**

FUNCTION: To release a record to an output file. To allow for vertical positioning if the output device is a printer.

FORMAT:

WRITE record-name [BEFORE ADVANCING {integer LINES}]
 {PAGE LINE} }

WRITE record-name [INVALID KEY imperative-statement]

RULES:

1. The record-name must be the name of a logical record in the FILE SECTION of the DATA DIVISION.
2. The reserved word PAGE issues a standard form feed (0CH) control character to the device driver.
3. Integer LINES issues the specified number of carriage return line feeds.
4. The INVALID KEY clause must be used for RANDOM files.
5. The requested record number must be placed in the RELATIVE KEY before writing to a RANDOM file.

EXAMPLE:

```
0900 P-ROUTINE.  
0901      WRITE PRINT-LINE BEFORE ADVANCING 2 LINES.  
0902      MOVE SPACES TO PRINT-LINE.  
0903      WRITE PRINT-LINE BEFORE ADVANCING PAGE.  
1000 WRITE-RANDOM.  
1001      MOVE 1000 TO KEY3.  
1002      WRITE D-RANDOM-OUT  
1003      INVALID KEY DISPLAY "INVALID KEY".  
1050 SEQ-WRITE.  
1051      WRITE D-REC.
```

SECTION V**INTRODUCTION**

COBOL (Common Business Oriented Language) is an easy to learn programming language that has been used for business applications since the early 1960s. Because COBOL uses simple English statements, programmers need not be concerned with the unique details of the computer and can therefore concentrate their energies on solving particular business problems. NEVADA COBOL is an up-to-date subset designed for small businesses using microprocessors.

A few years ago most programmers thought in terms of creating a program as if they were creating a work of art, which -like a painting- could never be changed. Today, programs are engineered and built the way a construction company designs and builds a home. In both approaches the objective is the completion of the program, but the "building a program" concept suggests an element of productivity and modularity.

In order to start any building project one must first know what the objectives are. In the case of writing a program the objective is to produce an efficient, easy to maintain, easy to change , easy to understand, easy to read program that solves the problem.

SIMPLICITY

In our opinion SIMPLE IS BETTER. We often see COBOL, FORTRAN, BASIC, and other languages so complicated with nested statements and abbreviated labels, that the original programmer can't understand the program six months later. In the business world it is important that the program be easily understood, because programs and businesses are always changing. They are never complete. They are conceived and born, they grow and change, and finally pass on. It is important that the program doesn't pass on before its time. By writing programs that are easily transported to other equipment and easy to change we can increase their longevity, thus increasing their value. So write and test your COBOL programs on a microprocessor and then run them in production on a giant machine when the time comes. Today, the greatest cost of a computer system is not the hardware, it's the software! That's because software is 95% labor. So make your labor efficient by writing simple programs to solve complex problems.

GLOSSARY

The terms that follow are defined in accordance with their meaning as used in this document describing NEVADA COBOL and may not have the same meaning for other languages.

These definitions are also intended to be either reference material or introductory material to be reviewed prior to reading the detailed language specifications. For this reason, these definitions are, in most instances, brief and do not include detailed syntactical rules. Also, some terms defined here are not yet implemented in NEVADA COBOL.

DEFINITIONS

Abbreviated combined relation condition - The combined condition that results from the explicit omission of a common subject or a common subject and common relational operator in a consecutive sequence of relation conditions.

Access Mode - The manner in which records are to be operated upon within a file.

Actual Decimal Point - The physical representation, using either of the decimal point characters period (.) or comma (,), of the decimal point position in a data item.

Alphabetic Character - A character that belongs to the following set of letters: A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z, and the space.

Alphanumeric character - Any character in the computer's character set.

Alternate Record Key - A key, other than the prime record key, whose contents identify a record within an indexed file.

Arithmetic Expression - An arithmetic expression can be an identifier or a numeric elementary item, a numeric literal, such identifiers and literals separated by arithmetic operators, two arithmetic expressions separated by an arithmetic operator, or an arithmetic expression enclosed in parentheses.

Arithmetic Operator - A single character, or a fixed two-character combination, that belongs to the following set:

character	meaning
+	addition

-	subtraction
*	multiplication
/	division
**	exponentiation

Ascending Key - A key upon the values of which data is ordered starting with the lowest value of key up to the highest value of key in accordance with the rules for comparing data items.

Assumed Decimal Point - A decimal point position which does not involve the existence of an actual character in a data item. The assumed decimal point has logical meaning but no physical representation.

At End Condition - A condition caused:

1. During the execution of a READ statement for a sequentially accessed file.
2. During the execution of a RETURN statement, when no next logical record exists for the associated sort or merge file.

Block - A physical unit of data that is normally composed of one or more logical records. For mass storage files, a block may contain a portion of a logical record. The size of a block has no direct relationship to the size of the file within which the block is contained or to the size of the logical record(s) that are either continued within the block or that overlap the block. The term is synonymous with physical record.

Called Program - A program which is the object of a CALL statement.

Calling Program - A program which executes a CALL to another program.

Character - A basic indivisible unit of the language.

Character Position - A character position is the amount of physical storage required to store a single standard data format character described as usage is DISPLAY.

Character-string - A sequence of contiguous characters which form a COBOL word, a literal, a PICTURE character-string, or a comment-entry.

Class condition - The proposition, for which a truth value can be determined, that the content of an item is wholly alphabetic or is wholly numeric.

Clause - A clause is an ordered set of consecutive COBOL character-strings whose purpose is to specify an attribute of an entry.

COBOL Character Set - The complete COBOL character set consists of the 51 characters listed below:

Character	Meaning
0,1,....9	digit
A,B,....Z	letter
	space (blank)
+	plus sign
-	minus sign (hyphen)
*	asterisk
/	stroke (virgule, slash)
=	equal sign
\$	currency sign
,	comma (decimal point)
;	semicolon
.	period (decimal point)
"	quotation mark
(left parenthesis
)	right parenthesis
>	greater than symbol
<	less than symbol

COBOL Word - (See Word)

Collating Sequence - The sequence in which the characters that are acceptable in a computer are ordered for purposes of sorting, merging, and comparing.

Column - A character position within a print line. The columns are numbered from 1, by 1, starting at the leftmost character position of the print line and extending to the rightmost position of the print line.

Combined Condition - A condition that is the result of connecting two or more conditions with the 'AND' or the 'OR' logical operator.

Comment-Entry - An entry in the Identification Division that may be any combination of characters from the COBOL character set.

Comment Line - A source program line represented by an asterisk in the indicator area of the line and any character from the computer's character set in area A and area B of that line. The comment line serves only for documentation in a program. A special form of comment line represented by a stroke (/) in the indicator area of the line and any characters from the computer's character set in area A and area B of that line causes page ejection prior to printing the comment.

Compile time - The time at which a COBOL source program is translated, by a COBOL compiler, to a COBOL object program.

Compiler Directing Statement - A statement, beginning with a compiler directing verb, that causes the compiler to take specific action during compilation.

Computer-Name - A system-name that identifies the computer upon which the program is to be compiled or run.

Condition - A status of a program at execution time for which a truth value can be determined. Where the term 'condition' (condition-1, condition-2,...) appears in these language specifications in or in reference to 'condition' (condition-1, condition-2, ...) of a general format, it is a conditional expression consisting of either a simple condition or a combined condition consisting of the syntactically correct combination of simple conditions, logical operators, and parentheses, for which a truth value can be determined.

Condition-Name - A user-defined word assigned to a specific value, set of values, or range of values, within the complete set of values that a conditional variable may possess.

Condition-Name Condition - The proposition, for which truth value can be determined, that the value of a conditional variable is a member of the set of values attributed to a condition-name associated with the conditional variable.

Conditional Expression - A simple condition or a complex condition specified in an IF, or PERFORM statement.

Conditional Statement - A conditional statement specifies that the truth value of a condition is to be determined and that the subsequent action of the object program is dependent on this truth value.

Conditional Variable - A data item one or more values of which has a condition-name assigned to it.

Configuration Section - A section of the Environment Division that describes overall specifications of source and object computers.

Connective - A reserved word that is used to:

1. Associate a data-name, paragraph-name, condition-name, or text-name with its qualifier.
2. Link two or more operands written in a series.
3. Form conditions.

Contiguous Item - Items that are described by consecutive entries in the Data Division, and that bear a definite hierarchic relationship to each other.

Counter - A data item used for storing numbers or number

representations in a manner that permits these numbers to be increased or decreased by the value of another number, or to be changed or reset to zero or to an arbitrary positive or negative value.

Currency Sign - A character '\$' of the COBOL character set.

Currency Symbol - The character defined by the CURRENCY SIGN clause in the SPECIAL-NAMES paragraph. If no CURRENCY SIGN clause is present in a COBOL source program, the currency symbol is identical to the currency sign.

Current Record - The record which is available in the record area associated with the file.

Current Record Pointer - A conceptual entity that is used in the selection of the next record.

Data Clause - A clause that appears in a data description entry in the Data Division and provides information describing a particular attribute of a data item.

Data Description Entry - An entry in the Data Division that is composed of a level-number followed by a data-name, if required, and then followed by a set of data clauses, as required.

Data Item - A character or a set of contiguous characters (excluding in either case literals) defined as a unit of data by the COBOL program.

Data-Name - A user-defined word that names a data item described in a data description entry in the Data Division. When used in the general formats, 'data-name' represents a word which can neither be subscripted, nor indexed unless specifically permitted by the rules for that format.

Debugging Line - A debugging line is any line with 'D' in the indicator area of the line.

Declaratives - A set of one or more special purpose sections, written at the beginning of the Procedure Division, the first of which is preceded by the key word DECLARATIVES and the last of which is followed by the key words END DECLARATIVES. A declarative is composed of a section header, followed by a USE compiler directing sentence, followed by a set of zero, one or more associated paragraphs.

Declarative-Sentence - A compiler-directing sentence consisting of a single USE statement terminated by the separator period.

Delimiter - A character or a sequence of contiguous

characters that identify the end of a string of characters and separates that string of characters from the following string of characters. A delimiter is not part of the string of characters that it delimits.

Descending Key - A key upon the values of which data is ordered starting with the highest value of key down to the lowest value of key, in accordance with the rules for comparing data items.

Digit Position - A digit position is the amount of physical storage required to store a single digit. This amount may vary depending on the usage of the data item describing the digit position.

Division - A set of zero, one or more sections of paragraphs, called the division body, that are formed and combined in accordance with a specific set of rules. There are four (4) divisions in a COBOL program: Identification, Environment, Data, and Procedure.

Division Header - A combination of words followed by a period and a space that indicates that beginning of a division. The division headers are:

IDENTIFICATION DIVISION.
ENVIRONMENT DIVISION.
DATA DIVISION.
PROCEDURE DIVISION [USING data-name-1 ...].

Dynamic Access - An access mode in which specific logical records can be obtained from or placed into a mass storage file in a non-sequential manner (see Random Access) and obtained from a file in a sequential manner (see Sequential Access), during the scope of the same OPEN statement.

Editing Character - A single character or a fixed two-character combination belonging to the following set:

Character	Meaning
B	space
0	zero
+	plus
-	minus
CR	credit
DB	debit
Z	zero suppress
*	check protect
\$	currency sign
,	comma (decimal point)
.	period (decimal point)
/	stroke (virgule, slash)

Elementary Item - A data item that is described as not being further logically subdivided.

End of Procedure Division - The physical position in a COBOL source program after which no further procedures appear.

Entry - Any descriptive set of consecutive clauses terminated by a period and written in the Identification Division, Environment Division, or Data Division of a COBOL source program.

Environment Clause - A clause that appears as part of an Environment Division entry.

Execution Time - (See Object Time).

Extended Mode - The state of a file after execution of an OPEN statement, with the EXTEND phrase specified, for that file and before the execution of a CLOSE statement for that file.

Figurative Constant - A compiler generated value referenced through the use of certain reserved words.

File - A collection of records.

File Clause - A clause that appears as part of a File description (FD).

FILE-CONTROL - The name of an Environment Division paragraph in which the data files for a given source program are declared.

File Description Entry - An entry in the File Section of the Data Division that is composed of the level indicator FD,

followed by a file-name, and then followed by a set of file clauses as required.

File-Name - A user-defined word that means a file described in a file description entry or a sort-merge file description entry within the File Section of the Data Division.

File Organization - The permanent logical file structure established at the time that a file is created.

File Section - The section of the Data Division that contains file description entries and sort-merge file description entries together with their associated record descriptions.

Format - A specific arrangement of a set of data.

Group Item - A named contiguous set of elementary or group items.

High Order End - The leftmost character of a string of characters.

I-O-CONTROL - The name of an Environment Division paragraph in which object program requirements for specific input-output techniques, rerun points, sharing of same areas by several data files, and multiple file storage on a single input-output device are specified.

I-O-MODE - The state of a file after execution of an OPEN statement, with the I-O phrase specified, for that file and before the execution of a CLOSE statement for that file.

Identifier - A data-name, followed as required, by the syntactically correct combination of qualifiers, subscripts, and indices necessary to make unique reference to a data item.

Imperative Statement - A statement that begins with an imperative verb and specifies an unconditional action to be taken. An imperative statement may consist of a sequence of imperative statements.

Index - A computer storage position or register, the contents of which represent the identification of a particular element in a table.

Index Data Item - A data item in which the value associated with an index-name can be stored in a form specified by the implementor.

Index-Name - A user-defined word that names an index associated with a specific table.

Indexed Data-Name - An identifier that is composed of a data-name, followed by one or more index-names enclosed in parentheses.

Indexed File - A file with indexed organization.

Indexed Organization - The permanent logical file structure in which each record is identified by the value of one or more keys within that record.

Input File - A file that is opened in the input mode.

Input Mode - The state of a file after execution of an OPEN statement, with the INPUT phrase specified, for that file and before the execution of a CLOSE statement for that file.

Input-Output File - A file that is opened in the I-O mode.

Input-Output Section - The section of the Environment Division that names the files and the external media required by an object program and which provides information required for transmission and handling of data during execution of the object program.

Integer - A numeric literal or a numeric data item that does not include any character positions to the right of the assumed decimal point. Where the term 'integer' appears in general formats, integer must not be a numeric data item, and must not be signed, nor zero unless explicitly allowed by the rules of that format.

Invalid Key Condition - A condition, at object time, caused when a specific value of the key associated with an indexed or relative file is determined to be invalid.

Key - A data item which identifies the location of a record, or a set of data items which serve to identify the ordering of data.

Key of Reference - The key, either prime or alternate, currently being used to access records within an indexed file.

Key Word - A reserved word whose presence is required when the format in which the word appears is used in a source program.

Language-Name - A system-name that specifies a particular programming language.

Level Indicator - Two alphabetic characters that identify a specific type of file or a position in hierarchy.

Level-Number - A user-defined word which indicates the

position of a data item in the hierarchical structure of a logical record or which indicates special properties of a data description entry. A level-number is expressed as a one or two digit number. Level-numbers in the range 1 through 49 indicate the position of a data item in the hierarchical structure of a logical record. Level-numbers in the range 1 through 9 may be written either as a single digit or as a zero followed by a significant digit. Level-numbers 66, 77, and 88 identify special properties of a data description entry.

Library-Name - A user-defined word that names a COBOL library that is to be used by the compiler for a given source program compilation.

Library Text - A sequence of character-strings and/or separators in a COBOL library.

Line Number - An integer that denotes the vertical position of a line on a page.

Linkage Section - The section in the Data Division of the called program that describes data items available from the calling program. These data items may be referred to by both the calling and called program.

Literal - A character-string whose value is implied by the ordered set of characters comprising the string.

Logical Operator - One of the reserved words AND, OR or NOT. In the formation of a condition, both or either of AND and OR can be used as logical connectives. NOT can be used for logical negation.

Logical Record - The most inclusive data item. The level-number for a record is 01.

Low Order End - The rightmost character of a string of characters.

Mass Storage - A storage medium on which data may be organized and maintained in both a sequential and nonsequential manner.

Mass Storage File - A collection of records that is assigned to a mass storage medium.

Mnemonic-Name - A user-defined word that is associated in the Environment Division with a specified implementor-name.

Native Character Set - The implementor-defined character set associated with the computer specified in the OBJECT-COMPUTER paragraph.

Native Collating Sequence - The implementor-defined collating sequence associated with the computer specified in the OBJECT-COMPUTER paragraph.

Negated Simple Condition - The 'NOT' logical operator immediately followed by a simple condition.

Next Executable Sentence - The next sentence to which control will be transferred after execution of the current statement is complete.

Next Executable Statement - The next statement to which control will be transferred after execution of the current statement is complete.

Next Record - The record which logically follows the current record of a file.

Noncontiguous Items - Elementary data items, in the Working-Storage and Linkage Section, which bear no hierarchic relationship to other data items.

Nonnumeric Item - A data item whose description permits its contents to be composed of any combination of characters taken from the computer's character set. Certain categories of nonnumeric items may be formed from more restricted character sets.

Nonnumeric Literal - A character-string bounded by quotation marks. The string of characters may include any character in the computer's character set. To represent a single quotation mark character within a nonnumeric literal, two contiguous quotation marks must be used.

Numeric Character - A character that belongs to the following set of digits: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9.

Numeric Item - A data item whose description restricts its contents to a value represented by characters chosen from the digits '0' through '9'; if signed, the item may also contain a '+', '-', or other representation of an operational sign.

Numeric Literal - A literal composed of one or more numeric characters that also contain either a decimal point, or an algebraic sign, or both. The decimal point must not be the rightmost character. The algebraic sign, if present, must be the leftmost character.

OBJECT-COMPUTER - The name of an Environment Division paragraph in which the computer environment, within which the object program is executed, is described.

Object of Entry - A set of operands and reserved words,

within a Data Division entry, that immediately follows the subject of the entry.

Object Program - A set or group of executable machine language instructions and other material designed to interact with data to provide problem solutions. In this context, an object program is generally the machine language result of the operation of a COBOL compiler on a source program. Where there is no danger of ambiguity, the word 'program' alone may be used in place of the phrase 'object program'.

Object Time - The time at which an object program is executed.

Open Mode - The state of a file after execution of an OPEN statement for that file and before the execution of a CLOSE statement for that file. The particular open mode is specified in the OPEN statement as either INPUT, OUTPUT, I-O or EXTEND.

Operand - Whereas the general definition of operand is 'that component which is operated upon', for the purposes of this publication, any lowercase word (words) that appears in a statement or entry format may be considered to be an operand and, as such, is an implied reference to the data indicated by the operand.

Operational Sign - An algebraic sign, associated with a numeric data item or a numeric literal, to indicate whether its value is positive or negative.

Optional Word - A reserved word that is included in a specific format only to improve the readability of the language and whose presence is optional to the user when the format in which the word appears is used in a source program.

Output File - A file that is opened in either the output mode or extend mode.

Output Mode - The state of a file after execution of an OPEN statement, with the OUTPUT or EXTEND phrase specified for that file and before the execution of a CLOSE statement for that file.

Page - A vertical division of a report representing a physical separation of report data, the separation being based on internal reporting requirements and/or external characteristics of the reporting medium.

Paragraph - In the Procedure Division, a paragraph-name followed by a period and a space and by zero, one, or more sentences. In the Identification and Environment Divisions, a paragraph header followed by zero, one, or more entries.

Paragraph Header - A reserved word, followed by a period and a space that indicates the beginning of a paragraph in the Identification and Environment Divisions. The permissible headers are:

In the Identification Division:

PROGRAM-ID.
AUTHOR.
INSTALLATION.
DATE-WRITTEN.
DATE-COMPILED.
SECURITY.

In the Enviroment Division:

SOURCE-COMPUTER.
OBJECT-COMPUTER.
SPECIAL-NAMES.
FILE-CONTROL.
I-O-CONTROL.

Paragraph-Name - A user-defined word that identifies and begins a paragraph in the Procedure Division.

Phrase - A phrase is an ordered set of one or more consecutive COBOL character-strings that form a portion of a COBOL procedural statement or of a COBOL clause.

Prime Record Key - A key whose contents uniquely identify a record within an indexed file.

Procedure - A paragraph or group of logically successive paragraphs, or a section or group of logically successive sections, within the Procedure Division.

Procedure-Name - A user-defined word which is used to name a paragraph or section in the Procedure Division. It consists of a paragraph-name or a section-name.

Program-Name - A user-defined word that identifies a COBOL source program.

Punctuation Character - A character that belongs to the following set:

Character	Meaning
,	comma
;	semicolon
.	period
"	quotation mark
(left parenthesis
)	right parenthesis
=	equal sign

Random Access - An access mode in which the program-specified value of a key data item identifies the logical record that is obtained from, deleted from or placed into a relative or indexed file.

Record - (See Logical Record).

Record Area - A storage area allocated for the purpose of processing the record described in a record description entry in the File Section.

Record Description Entry - The total set of data description entries associated with a particular record.

Record Key - A key, either the prime record key or an alternate record key, whose contents identify a record within an indexed file.

Record-Name - A user-defined word that names a record described in a record description entry in the Data Division.

Reference Format - A format that provides a standard method for describing COBOL source programs.

Relation Character - A character that belongs to the following set:

Character	Meaning
>	greater than
<	less than
=	equal to

Relation Condition - The proposition, for which a truth value can be determined, that the value of an arithmetic expression or data item has a specific relationship to the value of another arithmetic expression or data item.

Relational Operator - A reserved word, a relation character,

or group of consecutive reserved words, or a group of consecutive reserved words and relation characters used in the construction of a relation condition. The permissible operators and their meaning are:

Relational operator	Meaning
IS [NOT] GREATER THAN	
IS [NOT] >	Greater than or not greater
IS [NOT] LESS THAN	
IS [NOT] <	Less than or not less than
IS [NOT] EQUAL TO	
IS [NOT] =	Equal to or not equal to

Relative File - A file with relative organization.

Relative Key - A key whose contents identify a logical record in a relative file.

Relative Organization - The permanent logical file structure in which each record is uniquely identified by an integer value greater than zero, which specifies the record's logical ordinal position in the file.

Reserved Word - A COBOL word specified in the list of words which may be used in COBOL source programs, but which must not appear in the programs as user-defined words or system-names.

Routine-Name - A user-defined word that identifies a procedure written in a language other than COBOL.

Section - A set of zero, one, or more paragraphs or entries, called a section body, the first of which is preceded by a section header. Each section consists of the section header and the related section body.

Section Header - A combination of words followed by a period and a space that indicates the beginning of a section in the Environment, Data and Procedure Division.

In the Environment and Data Divisions, a section header is composed of reserved words followed by a period and a space. The permissible section headers are:

In the Environment Division:
CONFIGURATION SECTION.
INPUT-OUTPUT SECTION.

In the Data Division:
FILE SECTION.
WORKING-STORAGE SECTION.
LINKAGE SECTION.

In the Procedure Division, a section header is composed of a section-name, followed by the reserved word SECTION, followed by a segment-number (optional), followed by a period and a space.

Section-Name - A user-defined word which names a section in the Procedure Division.

Segment-Number - A user-defined word which classifies sections in the Procedure Division for purposes of segmentation. Segment-numbers may contain only characters '0', '1', ..., '9'. A segment-number may be expressed either as one or two digit number.

Sentence - A sequence of one or more statements, the last of which is terminated by a period followed by a space.

Separator - A punctuation character used to delimit character-strings.

Sequential Access - An access mode in which logical records are obtained from or placed into a file in a consecutive predecessor-to-successor logical record sequence determined by the order of records in the file.

Sequential File - A file with sequential organization.

Sequential Organization - The permanent logical file structure in which a record is identified by a predecessor-successor relationship established when the record is placed into the file.

Sign Condition - The proposition, for which a truth value can be determined, that the algebraic value of a data item or an arithmetic expression is either less than, greater than, or equal to zero.

Simple Condition - Any single condition chosen from the set:
relation condition
class condition
condition-name condition
sign condition

SOURCE-COMPUTER - The name of an Environment Division paragraph in which the computer environment, within which the source program is compiled, is described.

Source Program - Although it is recognized that a source program may be represented by other forms and symbols, in this document it always refers to a syntactically correct set of COBOL statements beginning with an Identification Division and ending with the end of the Procedure Division. In contexts where there is no danger of ambiguity, the word

'program' alone may be used in place of the phrase 'source program'.

Special Character - A character that belongs to the following set:

Character	Meaning
+	plus sign
-	minus sign
*	asterisk
/	stroke (virgule, slash)
=	equal sign
\$	currency sign
,	comma (decimal point)
:	semicolon
:	period (decimal point)
"	quotation mark
(left parenthesis
)	right parenthesis
>	greater than symbol
<	less than symbol

Special-Character Word - A reserved word which is an arithmetic operator or a relation character.

SPECIAL-NAMES - The name of an Environment Division paragraph in which implementor-names are related to user specified mnemonic-names.

Special Registers - Compiler generated storage areas whose primary use is to store information produced in conjunction with the user of specific COBOL features.

Standard Data Format - The concept used in describing the characteristics of data in a COBOL Data Division under which the characteristics or properties of the data are expressed in a form oriented to the appearance of the data on a printed page of infinite length and breadth, rather than a form oriented to the manner in which the data is stored internally in the computer, or on a particular external medium.

Statement - A syntactically valid combination of words and symbols written in the Procedure Division beginning with a verb.

Subject of Entry - An operand or reserved word that appears immediately following the level indicator or the level-number in a Data Division entry.

Subprogram - (See Called Program).

Subscript - An integer whose value identifies a particular element in a table.

Subscripted Data-Name - An identifier that is composed of a data-name followed by one or more subscripts enclosed in parentheses.

System-Name - A COBOL word which is used to communicate with the operating environment.

Table - A set of logically consecutive items of data that are defined in the Data Division by means of the OCCURS clause.

Table Element - A data item that belongs to the set of repeated items comprising a table.

Text-Name - A user-defined word which identifies library text.

Text-Word - Any character-string or separator, except space, in a COBOL library.

Truth Value - The representation of the result of the evaluation of a condition in terms of one of two values
 true
 false

Unary Operator - A plus (+) or a minus (-) sign, which precedes a variable or a left parenthesis in an arithmetic expression and which has the effect of multiplying the expression of +1 or -1 respectively.

User-Defined Word - A COBOL word that must be supplied by the user to satisfy the format of a clause or statement.

Variable - A data item whose value may be changed by execution of the object program. A variable used in an arithmetic expression must be a numeric elementary item.

Verb - A word that expresses an action to be taken by a COBOL compiler or object program.

Word - A character-string of not more than 30 characters which forms a user-defined word, a system-name, or a reserved word.

Working-Storage Section - The section of the Data Division that describes working storage data items, composed either of noncontiguous items or of working storage records or of both.

77-level-Description-Entry - A data description entry that describes a noncontiguous data item with the level-number 77.

LANGUAGE CONCEPTS

CHARACTER SET

The standard (ANSI-1974) COBOL character set consists of the following 51 characters:

0,1,...,9	digit
A,B,...,Z	letter
+	plus sign
-	minus sign (hyphen)
*	asterisk
/	stroke (virgule, slash)
=	equal sign
\$	currency sign
,	comma (decimal point)
;	semicolon
:	period (decimal point)
"	quotation mark
(left parenthesis
)	right parenthesis
>	greater than symbol
<	less than symbol

USER-DEFINED WORDS

A word contains not more than 30 characters from the set {A-Z,0-9, and -}. A user-defined word cannot begin or end with a (-) hyphen and must contain at least one alphabetic character.

PUNCTUATION

The period, comma, or semicolon must immediately follow the last character of a word and be followed by a space. The comma and the semicolon are interchangeable. The left parenthesis must not be followed by a space and the right parenthesis must not be preceded by a space.

EXAMPLE:

1234 MOVE MONEY (10) TO SAVING-AND-LOAN.

LITERALS**NUMERIC**

1. A numeric literal must contain from 1 to 18 characters.
2. A numeric literal cannot be bounded by quotation marks.
3. A numeric literal can contain a minus (-) sign as its left most character. If there is no minus sign the literal is assumed to be positive.
4. A decimal point (.) can appear within a numeric literal. If there is no decimal point the literal is assumed to be an integer. The decimal point cannot be to the immediate left of a minus sign or as the right most character in the literal.

NON-NUMERIC

1. A non-numeric literal must be bounded by quotation marks (""). The word quote cannot be used.
2. A non-numeric literal must contain from 1-120 characters.
3. Each imbedded pair of quotation marks creates one quotation mark in the literal.
4. A second set of quotation marks ("") can be used to bound hexadecimal values. Each hexadecimal value can be separated by a comma. Hexadecimal characters are from the set 0-9 and A-F.

EXAMPLE:

```
* note the following 2 lines would display ABC
0051      DISPLAY "ABC".
* the following is a hexadecimal literal for ABC
0050 GRAPHICS. DISPLAY ""41,42,43"".
* the following line would display a single quotation
* mark because of the imbedded pair of quotation marks.
0052      DISPLAY """".
0053      DISPLAY "LONG LINE CONTINUES TO NEXT LINE
0054-    " QUOTE IN COL 10 & - IN COL 5 IS NECESSARY".
* numeric literals
0060 MATH.      ADD 1 TO TOTAL-ITEMS.
0061      ADD 3.75 TO AMT-SAVED.
```

FIGURATIVE CONSTANTS

1. The reserved words ZERO, ZEROS or ZEROES represents one or more occurrences of the character zero (0).
2. The reserved words SPACE or SPACES represents one or more occurrences of the character space (blank).
3. The reserved words QUOTE or QUOTES represents one or more occurrences of the character quote ("").
4. The reserved words HIGH-VALUE or HIGH-VALUES represents one or more occurrences of the character FF Hexadecimal.
5. The reserved words LOW-VALUE or LOW-VALUES represents one or more occurrences of the character 00 Hexadecimal.
6. The reserved word ALL "literal" represents one or more occurrences of the single non-numeric literal character.

EXAMPLE:

```
0001      MOVE ALL "X" TO CUSTOMER-NAME.  
0002      IF CUSTOMER-NAME IS EQUAL TO ALL "X"  
0003          GO TO PRT-ALIGNMENT.  
0004      MOVE HIGH-VALUES TO OUT-RECORD.
```

SUBSCRIPTING

A subscript is an integer whose value determines the ordinal position of an item in a table. This value can cross record boundaries (4095) for large tables (30K - 40K+) in working-storage by having a series of tables and referencing the first one with a subscript value which points to an item in the second, third, ... table. However, if the subscript value is such that it crosses a record boundary and no table follows, then there is no error indication and the results are unspecified.

EXAMPLE:

```

0001 WORKING-STORAGE.
0002 01 TABLE.
0003    02 FILLER PIC X(9) VALUE "JANUARY   ".
0004    02 FILLER PIC X(9) VALUE "FEBRUARY  ".
0005    02 FILLER PIC X(9) VALUE "MARCH     ".
0006    02 FILLER PIC X(9) VALUE "APRIL     ".
0007    02 FILLER PIC X(9) VALUE "MAY       ".
0008    02 FILLER PIC X(9) VALUE "JUNE      ".
0009    02 FILLER PIC X(9) VALUE "JULY      ".
0010   02 FILLER PIC X(9) VALUE "AUGUST    ".
0011   02 FILLER PIC X(9) VALUE "SEPTEMBER".
0012   02 FILLER PIC X(9) VALUE "OCTOBER   ".
0013   02 FILLER PIC X(9) VALUE "NOVEMBER  ".
0014   02 FILLER PIC X(9) VALUE "DECEMBER  ".
0015 01 M-TBL REDEFINES TABLE.

```

SYMBOLS AND CONVENTIONS

The symbology used in this manual is the standard COBOL symbology and the carriage return symbol.

1. Lower-case characters represent data to be supplied by the programmer.
2. Underlined UPPER-CASE characters are key words that must be used.
3. Upper-case characters that are not underlined are optional reserved words.
4. Braces {} indicate that a choice must be made.
5. Square brackets [] indicate optional information.
6. Ellipsis (...), three consecutive periods, indicate that preceding clauses can be repeated.
7. The carriage return is indicated by <CR>.

SECTION VI

OPERATING PROCEDURES

HARDWARE REQUIRED

1. 8080/Z80/8085 microprocessor.
2. A minimum of 32K of RAM for the compiler.
3. Any disk drive.
4. Video display and keyboard.

SOFTWARE REQUIREMENTS

Digital Research Corp's CP/M operating system.
Any text editor that terminates a line with a carriage return line feed.

FILES ON THE DISTRIBUTION DISKETTE

CC.COM is the COBOL COMPILER and is always on the default drive at compile time.

W4.COM is a random file and is always on the default drive at compile time.

W5.CBL is the error message file and is always on the default drive at compile time. This file is a standard text file that may be changed by the user.

RUN.COM is the run time loader/subroutine code and can be on any drive. It is only used at run time.

ERRORS.COM displays the error report from the default drive. This program is used to re-display the error report from the last compile but is not required for compiling.

RENUMBER.CBL is a COBOL source code program that must be compiled before it can be used. It renumbers COBOL source programs.

CONFIG.CBL is a COBOL source code program that must be compiled before it can be used. It will configure the CRT for line length, BIOS and the delete character, etc.

CONVHEX.COM is used in conjunction with the CP/M assembler for those of you wishing to write called programs in assembly language. It converts (.HEX) files to (.OBJ) files. This program is executed as follows:

CONVHEX file-name[.HEX].

The program will create the output file if necessary with the same file-name and type

(.OBJ). If you do a lot of work in assembly language, you may want to get Nevada FORTRAN, as it comes with an assembler that is compatible with Nevada COBOL.

FILES NOT DISTRIBUTED BUT WILL BE CREATED AT COMPILE TIME.

W1.WRK is a work file and will be created on the default drive or the assigned drive at compile time.

W3.WRK is the error work file and will be created on the default drive at compile time.

GETTING STARTED

If the master disk is not write protected, do it now!

1. NEVADA COBOL is distributed on a DATA DISK without the CP/M operating system. There is no information on the system tracks, so don't try to "boot it up", it won't work!

2. On computer systems with the ability to read several disk formats, such as the KayPro computer, the master diskette must be used in disk drive B.

3. Do not try to copy the master diskette with a COPY program! On most systems it won't work. You must use the CP/M PIP command to copy the files.

4. You must first, prepare a CP/M system's diskette for use as your NEVADA COBOL operations diskette. On 5 1/4 inch diskettes you may have to remove (use the CP/M ERA command) most of the files in order to make room for the COBOL files. None of the CP/M files are needed for NEVADA COBOL, but PIP.COM and STAT.COM are useful if you have the space. You may want to do a CP/M STAT command on the distribution disk so you will know how much space you need on your operational diskette. For more information read the CP/M manuals about the STAT command.

5. Then insert the newly created CP/M diskette in disk drive A, and insert the NEVADA COBOL diskette in drive B and type (ctl-c) to initialize CP/M. Now copy all the files from the COBOL diskette onto the CP/M diskette:

PIP A:=B:.*[VO]

If you get a BDOS WRITE ERROR message from CP/M during the PIP operation it usually means the disk is full and you should erase more files from the operational diskette.

At this point, put the NEVADA COBOL diskette in a safe

place. You will not need it unless something happens to your operations diskette. By the way, back up your operations diskette with a copy each week! If your system malfunctions you can then pat yourself on the back for having a safe back up copy of your work.

Now, boot up the newly created NEVADA COBOL operations diskette. Notice that CP/M display's the amount of memory for which this version of CP/M has been specialized. (Note, some versions of CP/M don't give this information.) Compiling and executing of COBOL programs should be done on the same CP/M version or one of larger memory unless your COBOL programs are given an upper address limit. Also, do not write protect this operations diskette because during a compile data will be written onto it.

The next step should be to compile the program called CONFIG. This is done by typing the following:

A> CC CONFIG

The disk drives will work away and the COBOL compiler will finally display SUCCESSFUL COMPILE. If you have any problems compiling, read ahead about compiling a program, as on small disk drives you may have to assign files to other disk drives or make space available on the default drive. Normally, every thing should go smoothly and work properly, if the compiler has been copied correctly.

Next, type the following:

A>RUN CONFIG

where RUN.COM and CONFIG.OBJ are both on the current logged-in disk drive (A). The program CONFIG is used to specialize the RUN time package and asks the following questions:

ENTER SCREEN INFORMATION

ENTER 2-DIGIT HEXADECIMAL CODE FOR DELETE-KEY

 this is usually 08 the CP/M standard Ctl-H
 on the apple the backarrow is 15H

ENTER 2-DIGIT HEXADECIMAL CODE SENT TO BACKSPACE CURSOR

 this is usually 08

IS THE BACKSPACE PRECEDED WITH AN ESCAPE CHARACTER (Y/N) ?

 this is usually N

ENTER # OF CHARACTERS ACROSS SCREEN

 this is usually 64 or 80

ENTER # OF LINES PER SCREEN PAGE

 this is usually 16 or 24

DOES YOUR BIOS ISSUE A CR/LF

AT THE END OF EACH LINE (Y/N) ?

 this is usually Y

DOES YOUR PRINTER REQUIRE A LINE FEED (Y/N) ?

this is usually Y
DO YOU WANT TO USE CPM FUNCTION 1 & 2
CONSOLE I-O (Y/N)?
 if N other info will be displayed
 answer N if you will be sending escape characters
 to the CRT.
DOES YOUR CPM BACKSPACE AND BLANK THE
DELETED CHARACTER (Y/N)?
 this is usually N
DO YOU WANT TO ACCEPT ANY HEX CHARACTER
OR ONLY DISPLAY ASCII (H/A)?
 this is usually A
EOJ CONFIG RETURNING TO CPM

Once the CONFIG program has been run and you are satisfied with the way the ACCEPT/DISPLAY functions, the programs are no longer needed on the operational diskette and may be removed as follows:

A>ERA CONFIG.*

On some single density 5 1/4 diskettes, you may want to have a separate diskette for compiling only. This diskette needs only the following files:

CC.COM about 6K.
W4.COM about 30K.
W5.COM about 6K.

And at run time you can also have a separate disk. It only needs one file:

RUN.COM about 12K.

with this diskette file arrangement, the COBOL compiler will work on diskettes with very limited disk space.

BUILDING A PROGRAM

The first step is to create a COBOL source program file. This file will latter be submitted to the COBOL compiler for compilation. Create the file by using a text editor such as NEVADA EDIT. You can copy an existing COBOL source file such as RENUMBER.CBL that is on the NEVADA COBOL distribution disk and create a new program file called, for example, MYPROG.CBL. Then modify MYPROG.CBL as required. This saves keying time as well as avoiding the possibility of misspelling required key words.

Each line of the COBOL source file must be terminated with a carriage return line feed. This is automatically done with NEVADA EDIT, ED (text editor that comes with CP/M), or Word

Star (Word Star is a trademark of Micro Pro). If you use ED or WORD STAR avoid tabing and in the case of WORD STAR, you must use the non-document mode. Remember, these COBOL source files must have the CP/M file extension of (.CBL).

We recommend you use NEVADA EDIT because of it's superior tabing features and because it only uses 12K of disk space.

You can use the RENUMBER program to automatically number or renumber the source program.

COBOL CODING FORMAT	ANSI-1974	NEVADA COBOL
	column	column
Sequence number	1-6	1-4
Indicator area	7	5
A-field	8-11	6-9
B-field	12-72	10-70

1. The user can use either format as the compiler looks at the first line of the source program and determines either 4 position or 6 position line numbers are used. When converting ANSI programs to NEVADA COBOL (or vice versa) adjust the sequence number by two positions and the other columns will align properly. We felt that 9999 sequence numbers would be enough for microprocessors and would also be compatible with other microprocessor software (ie. RENUMBER, edits, etc.).

2. The indicator area can contain only the following:

- * which indicates a comments line.
- / which indicates a comments line after head of forms.
- SPACE which indicates a standard COBOL statement line.
- D which indicates a Debugging line.
- which indicates a continuation line. When a non-numeric literal is continued a quotation mark ("") must also appear in column 10.

All other characters are flagged by the compiler and are treated as comment lines.

3. Sequential line numbers are required because all errors are referenced by line number.

4. Each line must be terminated by a carriage return line feed (0D0A hex).

EXAMPLE:

Columns

123456789012345678901234567890

0001 IDENTIFICATION DIVISION.

0002* this is a comment line. the next line is blank

0003*

COMPILE A PROGRAM

To compile a program simply type CC file-name. A copyright message will appear until the error report is displayed or until the successful compile message is displayed. Using the error report line number/message correct the source and recompile if necessary. The compile can be interrupted (aborted) by pressing the CONTROL-C keys. In the following examples the CP/M operating system gives the prompt A> and the user types in the rest of the line.

A>CC RENUMBER<CR>

in the above case, the source file RENUMBER.CBL is on the default drive. The object code file will be created if necessary on the default drive with the file-name of RENUMBER.OBJ. The work file W1 will be created if necessary on the default drive.

A>CC SOURCE.BBB<CR>

in the above example, all assignable files are on disk drive B. The type field is used for drive assignment. The first position is for the source file, the second position is for the object file and the third position is for W1 a large work file. All source files must be type '.CBL'.

A>CC CONFIG.ABB<CR>

in the above case, the source file CONFIG.CBL is on drive (A) and the object file CONFIG.OBJ will be created if necessary on drive (B) as will the work file W1.WRK.

Warning: If you forget and type CC file-name.CBL you will get a CP/M BDOS Select ERROR. Because the compiler will look for drive C: or L: in error.

EXECUTING A PROGRAM

Once the object file has been produced, the program can be executed by simply typing RUN file-name. The run time package is called RUN and lives in memory locations 100H to 2EFFH. It contains a special loader and all the required run time subroutines. Execution of the program can be interrupted (aborted) by pressing the CONTROL C keys.

A>RUN u:OBJECT<CR>

in the above case, RUN is on the current logged-in drive A and OBJECT is on some other disk drive u:

B>RUN A:PAYROLL<CR>

in the above case RUN.COM is on the current logged-in drive (B) and PAYROLL.OBJ is on drive (A).

A>RUN RENUMBER<CR>

where RUN.COM and the object program RENUMBER.OBJ are both on the current logged-in disk drive (A). The program RENUMBER is used to renumber the first four positions of COBOL source code programs. After loading it asks the question:

ENTER FILE NAME A:FILENAME.TYP

at this point the user enters his program-name.

A:CONFIG.CBL

the program then rennumbers the requested file-name and when complete displays:

RENUMBERING COMPLETE

In some cases the renumber program issues error messages. If a input line is all spaces (blank) or if any of the first four positions contain a tab character (09H) the user is notified that the line has been skipped. This is because the renumber program uses the rewrite statement which cannot expand the input. Warning, on some implementations of cpm it has been reported that these blank lines cause the file to be destroyed. If this should happen you must not use blank lines or tabs!

EXAMPLE:

Columns

1234567890123456

0001*

*

9999/ head of form comment line is ok

LISTING A PROGRAM

To list a NEVADA COBOL source code program use the CP/M TYPE command and if you have a printer use (ctl-p).

A>TYPE RENUMBER.CBL[CTL-P]<CR>

A>TYPE CONFIG.CBL<CR>

A>TYPE W5.CBL<CR>

SECTION VII

ERROR CODES AND MESSAGES

COMPILER ERROR MESSAGES

During compilation all error codes are output to a disk work file (W3.WRK). At the end of each COBOL Division the compiler checks for any fatal errors and terminates the compile if any have been found. At the end of compilation a report is displayed and is available for redisplay using the program ERRORS if needed:

A>ERRORS<CR>.

Using the CP/M feature control-p, the error messages can also be sent to the printer as they are displayed. Also, control-s can be used to stop and start the report.

All of the compiler error messages are contained on a file named W5.CBL and can be changed by the user. For example, you may want to have your error messages displayed in German or some other language. These messages can be more than one line and upper-case or lower-case. See error code number 003 below for an example.

The LVL (level) codes are F for Fatal (no object code generated) and W for Warning Possible Error. Also, not shown below each line is preceeded by the source programs actual line number.

SEQ	ERR	
NO. COL	LVL	TEXT

RUN TIME AND COMPILE TIME ERROR MESSAGES

The runtime package will display the unit and file-name following the error codes. The following codes are also used in the STATUS keys when specified.

90 No additional information
 91 Error in extending the file
 92 end of disk data - disk is full
 93 file not open
 94 no more directory space - disk is full
 95 file cannot be found
 96 file already open
 97 reading unwritten data in random access
 98 rewrite without prior read in I-O MODE
 99 reading an output file or writing to an input file

100 ERROR MESSAGE NOT IN TABLE
 Please send the code to Ellis Computing.
 101 SUBSCRIPT ERROR value exceeds 65K.
 102 BOUNDARY ERROR program fell through last paragraph.

Note: The RUN time package must be the one distributed with the current version of the compiler. Older version will not work. Also older versions of the object code programs will not work with current RUN time packages and must be recompiled.

SECTION IX

A COBOL PRIMER

INTRODUCTION

The NEVADA COBOL system consists of three elements: a language, a compiler and a run time package. The language is used by the programmer in writing the source program. The compiler is a program that processes programmer-written COBOL sentences and produces (compiles) an object program (a program that is in machine language). The run time package loads the object program and also contains subroutines used by the object program.

ANALYSIS & DESIGN

This topic is too large to be covered here. The reader should consult one of the many books on this subject. In general, to prepare a business problem for solution, the first step is to thoroughly describe the functions to be performed and the objectives to be accomplished. One of the most important parts of this analysis is the description of the format of the input and output data. Special forms are usually used. The form used for printers is called a printer layout form and the form used for other files, such as Disk or Tape, is called a Record layout form.

THE PROGRAM

After a job has been defined the program can be written. The COBOL language was created specifically to facilitate the processing of data generated by business and industry.

Every COBOL program consists of four separate divisions, or parts:

- | | |
|----------------------------|---|
| 1. IDENTIFICATION DIVISION | Identifies the program. |
| 2. ENVIRONMENT DIVISION | Describes the computer used and the hardware available. |
| 3. DATA DIVISION | Describes the files, record layouts and storage areas. |
| 4. PROCEDURE DIVISION | States the program logic. |

The first division is the **IDENTIFICATION DIVISION**. It provides all of the necessary documentation for the program such as the program name, the programmer's name, the system or application to which the program belongs, the security restrictions on the use of the program, the dates on which

the program was written and compiled. Look in the manual for the IDENTIFICATION DIVISION Chapter for an example.

The format for the second division, the **ENVIRONMENT DIVISION**, is the same as that of the IDENTIFICATION DIVISION. In addition to fixed paragraph-names, there are also fixed section-names. These section-names, like the division-name, appear as single entries on individual lines. Each section contains one or more paragraphs. The last character of the section-name is followed by a space, the word SECTION, and a period.

ENVIRONMENT DIVISION.

CONFIGURATION SECTION.

SOURCE-COMPUTER. The computer that will be used in compiling the source program (8080-CPU).

OBJECT-COMPUTER. The computer that will be used in executing the compiled object program (8080-CPU).

INPUT-OUTPUT SECTION.

FILE-CONTROL. In this paragraph the programmer supplies the computer with two facts concerning each data file used in the program:

1. The name of the file - a unique thirty-character name created by the programmer. This name will be used in other divisions of the program whenever referencing the file.
2. The hardware input/output device to which the file is assigned
Disk
Printer

The format which must be supplied for each input or output data file is

SELECT (file-name) ASSIGN TO (hardware-device)

The third division is the **DATA DIVISION**. Data processed by a COBOL program fall into four categories:

1. Data read from input files or written on output files. Memory areas must be reserved into which the data can be read or from which the data can be written.
2. Data which is developed internally, such as totals, and placed into intermediate storage areas.
3. Stored constant values (literals) which are required by the program.
4. Data from other COBOL programs.

To define these area, the DATA DIVISION consists of three sections. The FILE SECTION in which files and the input/output areas are described. For each file named in the FILE-CONTROL paragraph the file name, the record name, the layout of the record and the name, location, size, and

format of each field. The WORKING-STORAGE SECTION in which the intermediate storage areas and constant values are defined. The size, format, and content of every counter, storage area, or constant value used by the program. And, the LINKAGE SECTION for accessing information from other programs.

The fourth and last division is the **PROCEDURE DIVISION**. It is divided into programmer-created paragraphs and sections, containing all of the procedure statements which constitute the steps to be followed in processing the data.

TESTING

Most source programs contain clerical errors the first time they are run, so the first output of a compilation run is usually a listing of errors. The COBOL compiler will diagnose each clerical error it finds and display what are called diagnostics. There are two types of diagnostics - warnings and fatals. Warnings will not prevent compilation of the source program, but fatals will prevent compilation.

Getting the errors out of a source program is called "debugging". If there is a source program error, the program will have to be debugged and compiled again. This cycle is repeated until compilation is successful and an error free object program is produced.

The compiler cannot detect most logical errors. Thus it is possible to produce an object program file that will not solve the problem correctly. For example, suppose "ADD" has been written when the task called for a "SUBTRACT" instruction. The "ADD" instruction will compile, but the resulting object program will not solve the problem correctly. This means that each program must be tested with known data so the results can be verified. Once this is done the program can be run and the business problem "solved".

WORDS

One of the advantages of COBOL is achieved through the standardization of words.

ADD FIRST-NUMBER TO SECOND-NUMBER GIVING RESULT-OF-ADDITION.

You can see from this example COBOL is relatively easy to learn because, for the most part, it uses words from the English language. People can read the source listing and tell what the program does, what hardware it needs, etc. They know who to go to with questions about the program, and how current the program is. We call this feature documentation and it's one of the most important advantages of COBOL. Many of the entries in COBOL are not required,

they are optional. However, they should generally be included in the source program because they add to the documentation.

COBOL words can be broken down into two major categories - reserved words and nonreserved words. A COBOL programmer must not use reserved words for file-names, data-names, etc. Nonreserved words must be used.

MOVE CUSTOMERS-NAME TO PRINT-CUSTOMER-NAME.

The above is an excerpt from a COBOL source program. The reserved words are underlined. The remaining words were made up by the programmer.

Now look in the manual at the list of COBOL reserved words. When writing a COBOL source program, if you are not sure about a data-name you supply, you would first check the list of COBOL reserved words because these words cannot be used.

COBOL words may be constructed from a limited set of characters, following certain rules. COBOL words may contain as many as 30 characters. These characters may be any of the 26 letters, 10 numeric characters, and the "-" or hyphen. Hyphens may be used in COBOL words anywhere except at the beginning or the end of a word.

DCROAB-1 and BALANCE-DATA can both be used as COBOL words since they contain only letters of the alphabet, numeric characters, and hyphens and have no more than 30 characters. A1042 can be a COBOL word, but A10.42 cannot, because A10.42 contains a decimal point (period), which is not an allowable character in a COBOL word.

A word may be ended by a space, or by a period, right parenthesis, comma, or semicolon. Therefore, spaces in the middle of COBOL words are not permissible. TAX-RATE is a legal, nonreserved COBOL word, but TAX RATE is not.

File-names, record-names, and individual item-names must all conform to the rules for the construction of data-names. A data-name must include at least one alphabetic character, must not contain any spaces and must not exceed 30 characters. A data-name may not begin or end with a hyphen, although this character may be contained within a data-name. It is usually convenient to use data-names which suggest the data content, however, it is important that a data-name is not spelled the same as a word on the list of reserved words.

If you don't want to specify a data-name, you can use the word FILLER. Data-name is used to specify the name of the data being described. FILLER is used to specify an unused portion of the logical record. If you want to reference a

portion of your record, you cannot call it FILLER. MOVE FILLER TO NAME-FIELD would be an illegal entry because you may never directly reference FILLER. The only way to reference FILLER data is through a group item name.

COBOL language is compatible because it can be compiled by any computer which has a COBOL compiler. Reserved words provide COBOL with this quality of compatibility.

PUNCTUATION

In English, punctuation is used to separate words, clauses and sentences, so that the meaning is clearly understood. In COBOL, for the same purpose, specific punctuation marks are used. Punctuation rules for the four COBOL divisions are specified in the manual along with the division entries. The words, IDENTIFICATION DIVISION, must be followed by a period. The IDENTIFICATION DIVISION paragraphs may consist of any statement or sentence, but each one must be ended with a period.

Incorrect punctuation can cause fatal diagnostics at compile time. Some punctuation errors will cause warnings to be reported, but others will stop compilation and cause a fatal diagnostic. A frequent diagnostic is "SYNTAX ERROR". "SYNTAX" refers to the rules governing the structure of a language. Many clerical errors that cannot be otherwise analyzed will result in a diagnostic of SYNTAX ERROR. A file-name in the DATA DIVISION must match exactly the same file-name in the ENVIRONMENT DIVISION and the PROCEDURE DIVISION. If it does not match, at compilation time you will receive a fatal diagnostic of the error.

FORMAT

Look in the manual for the paragraph on Symbols and Conventions. Just as COBOL words are standardized for use in source programs, program format is also standardized. Optional entries are shown in square brackets. However, if you decide to use an option, then you must use the complete format in the brackets.

[; BLOCK CONTAINS integer-1 CHARACTERS]

If you use the above optional clause, you must use the words BLOCK and CHARACTERS. You may use the optional word CONTAINS. Note that programmer-supplied information is always required so you must supply integer-1.

THE DATA DIVISION

The purpose of the DATA DIVISION is to describe the data upon which the processing (as stated in the PROCEDURE DIVISION) will be performed.

DATA DIVISION.**FILE SECTION.**

Every file selected in the FILE-CONTROL paragraph of the INPUT-OUTPUT SECTION must have two sets of entries in the FILE SECTION.

1. File Description (FD)

- a. Name of the file (same name as in FILE-CONTROL).
- b. LABEL RECORDS ARE STANDARD or OMITTED.
 VALUE OF FILE-ID IS "value" or data-name.
- c. The programmer-created name assigned to a record of the file.
 DATA RECORD IS (record-name).
 the programmer must supply a unique record-name.

2. Record description (01)

The record description entries are located just below the file description. It is the record description which tells the compiler how to set up a record area for each file in which input records can be stored and processed and output records assembled and written. It provides the compiler with the format, or PICTURE, of one record of the file. Each entry begins with a level number followed by at least one space, the name of the data item, and a sequence of independent clauses descriptive of the item. The last clause is terminated by a period and space.

Position -

The record is always described from left to right, i.e., from print position 1 to print position 132 for print files. Every column or print position must be accounted for.

Level -

The first step in preparing a record description entry is the assignment of level-numbers. Level-numbers are used to show the hierarchy of data within a logical record. There may be forty-nine different levels specified for a record, numbered 01 through 49.

The name assigned to the entire record always has the highest level (01). Major divisions (fields) within the record are assigned the next lowest level (02). Subfields within these major divisions are assigned still lower levels (03,04,05 etc.). To show that an elementary item (or field) belongs to a group item, you assign it a higher level-number

than the group item.

```
02 CUST-CODE
02 CUST-NAME
  03 LAST-NAME
  03 FIRST-NAME
02 CUST-ADDRESS
```

Notice that you signify the end of a group item by using a level-number item equal to or less than the level-number of the group item.

In the FD entry, the letters "FD" immediately precede the file-name. They tell the compiler (and the user) that the next word is the name of the file. In a record description entry, the level number "01" immediately precedes the record-name. It tells the compiler (and the user) that the next word is the record-name.

Name -

Every field within the record is assigned a unique name of up to thirty characters. This name is used to reference the field in PROCEDURE DIVISION statements. Any unreferenced fields can be assigned the name FILLER.

Following the level-number and data-name are a series of independent clauses.

Format -

Each field must be described as to size, type (numeric, alphabetic, or alphanumeric), location of the actual or assumed decimal point, and any editing desired. This description is given in the form of a PICTURE, using special PICTURE symbols

```
9 - One numeric field position
A - One alphabetic field position
X - One alphanumeric field position; also used
      to describe FILLER positions.
```

Assumed decimal point location -

```
V - Location of imaginary decimal point; does
      not occupy an actual field position and is
      not counted in determining the size of the
      field.
```

Editing characters (used to indicate editing on fields contained in print record lines) -

```
. - Actual decimal point to be inserted in the
      field where shown.
```

```
, - Actual comma to be inserted in the field
      where shown.
```

```
Z - Indicates that all leading zeros and commas
      are to be suppressed before printing this
      field.
```

Abbreviations - Instead of having to write out a whole string of identical character symbols in describing a PICTURE, COBOL allows you to write the symbol once, followed by a set of parentheses within which the number of repetitions of that character symbol is indicated. The number of characters in a PICTURE clause is limited to 30. PICTURE abbreviations such as),(and S are counted in the size of the PICTURE clause.

A seven-position numeric field

9999999 or 9(7)

An eight-position numeric field with two cent positions

9999999V99 or 9(6)V99

A twenty-position alphanumeric field

XXXXXXXXXXXXXXXXXXXX or X(20)

Using the PICTURE clause we can also insert a dollar sign, commas, and a decimal point in a numeric value. Below are PICTURES of input fields, which will be MOVED to output printer fields, where we want them to be edited as monetary values.

input	output
1. PICTURE IS 9(4)	PICTURE IS \$9,999
2. PICTURE 9V99	PICTURE IS \$9.99
3. PICTURE 9(8)V99	PICTURE IS \$99,999,999.99

Note in the examples that each PICTURE has enough 9's to hold the entire incoming value, in addition to the insertion characters. When editing a numeric value, you must be sure to have enough 9's to hold the entire value (unless you want to truncate or round it off).

Numeric data to be printed out, especially monetary values, will often have insertion characters put in. Other data, such as input data, or output disk data, will rarely have insertion characters, but will often have operational characters (such as S and V).

Nonintegral input data will usually be described with an assumed decimal point. If data is to be used in arithmetic operations, it may not have an actual decimal point. It must have an assumed decimal point, if any decimal point at all. The PICTURE symbol for an assumed decimal point is V. An actual decimal point cannot be specified without using a PICTURE clause.

The only time a "+" will be printed out is if you specify "+" in the PICTURE and the value stored is positive. If "-", "CR", or "DB" are specified in a PICTURE, and the value received is positive, spaces (blanks) will be printed out.

In some programs, a negative value will represent a credit (such as returned items on a charge account). In others, they will represent a debit (such as accounts due and payable to wholesale suppliers). In the first case, you would use the characters CR in the receiving field; in the second case DB.

Unless otherwise specified, all data is considered positive. To change this, an input data field must contain a standard operational sign, and an output field must contain either a + - CR DB or a standard operational sign.

X-FLD PICTURE IS 9(3)V99. Y-FLD PICTURE IS +9(3).99.

If you MOVED X-FLD to Y-FLD, the report sign in Y-FLD will always be "+" because X-FLD will always be considered positive.

X-FLD PICTURE IS S9(3)V99. Y-FLD PICTURE IS +9(3).99.

The PICTURE of X-FLD has been changed; the S stands for a standard operational sign. Now the report sign in Y-FLD will vary according to whether the value in X-FLD is positive or negative.

Floating Characters

The following symbols may be used as floating zero suppression characters + - \$. The other two (nonfloating) zero suppression characters are * and Z.

If the value of (-)003v19 were to be moved to a receiving field described by the PICTURE \$\$\$\$,.99DB, the appearance of the receiving field would be \$3.19DB

When a floating dollar sign is given, it represents a 9 in all but the leftmost position. That is, \$\$\$\$.99 will hold 5 numeric digits.

Sending field	45612v34
Receiving field	\$\$\$\$,.99
value	\$5612.34

In the above example, the most significant digit of the value the 4, was truncated to make room for the dollar sign. To prevent that from happening, the receiving field should have been described as PICTURE IS \$\$\$\$\$.99

OCCURS clause

When describing data which is repeated, the use of the OCCURS clause eliminates the need for separate entries. Whenever the data-name which is the subject of an OCCURS clause is used as an operand, it must be subscripted.

```
IF SEAT-AVAIL-CODE (39) = "Y" . . .
```

The example above indicates that reference is being made to seat 39(the 39th occurrence of this entry). (39) is a subscript.

The reference format rules for parentheses are summarized as follows:

1. A left parenthesis must be preceded by a space; a right parenthesis must be followed by a space.
2. A left parenthesis must not be followed by a space; a right parenthesis must not be preceded by a space.

The subscript must be, or represent, an integer. The subscript may be a literal or a data-name. If the subscript is a data-name, the value stored in the data-name field must be an integer.

A 32 character entry may not occur 128 times in any record because it would require more than 4,095 characters of computer memory. But you can get around this limitation by setting up several records of up to 4,095 each in a row and then subscripting the first one accessing the information in all of them.

REDEFINES clause

It is often advantageous to be able to call memory areas by more than one name. The REDEFINES clause allows us to give a name to a field which crosses from one elementary item into the next. Note that, in the FILE SECTION, REDEFINES may not be used on the 01 level. To redefine an entire record, you need only name the new record in the DATA RECORDS clause (this implicitly redefines it).

The format of the REDEFINES clause shows nothing may come between data-name-1 and the REDEFINES clause.

A file (whether tape, disk, or printer) is simply a collection of records. For example, a printer file would be a long sheet of paper, on which each line is a record. Normally, a printer prints 132 characters per line. Therefore most printer records would contain 132 characters.

Disk files have different physical limitations. In NEVADA COBOL, a logical disk record is limited to 4095 characters. However, it is not likely that you will be using a record that large.

The FILE SECTION of the DATA DIVISION is composed of one or more file description entries. If three files are used by the program, there will be 3 FD entries in the DATA DIVISION. Files contain records which in turn contain data.

The files described so far have each had one type of data record. This is not always the case. Files may have more than one type of data record. Find the DATA RECORDS clause under FILE DESCRIPTION in the manual. The format shows that the programmer can supply record-name-1, record-name-2 . . .

FD DISK-FILE . . .

DATA RECORDS ARE CONTROL-REC, INFO-REC,
SPECIAL-REC.

The DISK-FILE file contains 3 types of data records. Each type has been assigned a record-name. A file description entry must be followed by one 01 level entry (and its associated 02,03,etc level entries) for each type of data record only. One of them can be stored in memory at a time. In order to store a record of different sizes, the computer would have to reserve enough area for the larger of the two types of records. The computer cannot distinguish whether the record currently stored in memory is in INFO-REC or CONTROL-REC format. It is up to the programmer via programming to determine which record is in memory.

WORKING-STORAGE SECTION

A second part of the DATA DIVISION is called the WORKING-STORAGE SECTION. It is in this section that we set up all of the counters and stored values as we find they are needed while coding the application. The format for each entry is very similar to the format for defining any of the data fields in the FILE SECTION. Every elementary WORKING-STORAGE item must be described by a PICTURE clause. In addition to the level-number, data-name, and format, the programmer can also specify that the field or area be set to some initial value. This initial value is expressed in a VALUE IS clause following the PICTURE format. The value itself is written as either a numeric or a non-numeric literal. Values for numeric fields (those defined by 9 and V symbols) are coded as numeric literals

100
-65
2.50

Values for non-numeric fields (those defined by A or X

symbols) must be coded as non-numeric literals. A non-numeric literal is always enclosed in quotation marks.

```
" CUSTOMER NAME "
"PROFITS FOR 1981"
```

Every space within the quotation marks is counted as a position. The maximum length of any single non-numeric literal is 120 character positions.

Output data often is edited and cannot be used as arithmetic operands. Thus, until it is time to actually write this data, it is often handy to store it in an unedited field. This field would be located in the WORKING-STORAGE SECTION.

While the WORKING-STORAGE SECTION does not contain files, it may contain logical records and therefore be defined by record description entries.

Often, WORKING-STORAGE fields bear no relationship to each other, and are called noncontiguous (not adjacent) fields. However, sometimes it is handy to have group items (so you can MOVE groups, etc). These items are called contiguous (adjacent) fields. A special level number, 77, is used to define items which are not part of a group item. That is, level number 77 indicates a noncontiguous item. Each separate, noncontiguous Record Description must begin with level-number 77 and include a data-name and a PICTURE clause.

PROCEDURE DIVISION

In this last division of the COBOL program, the processing steps are coded as an English-language statement according to the rules and conventions of the COBOL language. Verb statements are combined to form sentences, which are the basic units in this division. Sentences, one or more, are grouped according to procedure to form paragraphs. The paragraphs in turn are combined to form sections. As in other COBOL divisions, paragraphs and sections must be named.

For example, a series of statements required to print the title and column headings at the top of each page might be grouped together under the paragraph-name TOP-OF-PAGE. If, at some point in the program, the programmer wishes to execute this routine, he simply writes the statement PERFORM TOP-OF-PAGE.

In English, words which describe action are called verbs. In COBOL, words which describe procedures are also called verbs.

Example

```
OPEN INPUT DATA-FILE.  
READ DATA-FILE AT END CLOSE DATA-FILE, STOP RUN.  
ADD FIRST-NUMBER TO SECOND-NUMBER GIVING  
    GIVING RESULT-OF-ADDITION.
```

In this example, OPEN, READ and ADD are examples of verbs which specify the procedures to be followed in processing the data.

The number of different kinds of statements that can be written depends upon the number of COBOL verbs (ADD, GO TO, IF, MOVE, READ, etc.) which the compiler can handle. Every procedural statement must begin with one of these verbs, and each verb has its own unique statement format which must be followed. Only one procedural statement should be written on each line.

Most verb statements contain a verb followed by one or more operands. The word which describes the processing is the verb, while the name of the data to be processed is indicated by the operand.

```
SUBTRACT TAXES FROM GROSS-PAY.
```

In the example above, SUBTRACT is the verb, TAXES and GROSS-PAY are its operands.

The minimum form of a statement consists of a verb and its operands.

```
MOVE CUST-NAME TO PRT-CUST-NAME; GO TO COMPUTE-BALANCE.
```

Larger statements may consist of two or more minimum statements. There are a total of 3 statements represented by the above entry (two individual + one overall). The individual statements have been separated by the punctuation mark semicolon (;). No punctuation is ever required between statements, it is optional. However, to make the statement easier to read, you could use a separator. The allowable separators are ;(semicolon) ,(comma).

SENTENCES

A sentence consists of a sequence of one or more statements, the last of which is terminated by a period. In COBOL, sentences describe the procedure that is to be accomplished. The sentences are written successively, according to the rules of the reference format. The order in which the sentences are written is important because the sequence of the sentences establishes the order in which the procedures are executed.

PROCEDURE DIVISION.

BEGINING.

```
OPEN INPUT CUSTOMERS-TRANSACTIONS;
OPEN OUTPUT CUSTOMER-STATEMENT.
MOVE SPACES TO HEADING.
```

READ CUSTOMERS-TRANSACTIONS; AT END STOP RUN.

Sentences executing a particular procedure are grouped to form a paragraph. In the example above, there are 3 sentences in the paragraph named BEGINING.

```
0001 PRINT-TRANSACTION.
0002      MOVE AMOUNT TO AMOUNT-FIELD.
0003      WRITE HEADING.
0004 DISK-FILE-READ.
0005      READ CUSTOMERS-TRANSACTIONS;
0006          AT END GO TO TRANSFER-DISK.
0007      GO TO ACCT-NO-MATCH.
```

Paragraph-names must begin under position A (see COBOL Coding Format in the manual). In the example above, there are 2 paragraphs named PRINT-TRANSACTION and DISK-FILE-READ. Beginning under position B are the sentences which form each paragraph.

Paragraph-names are used so that one procedure can reference another by its name. Normally sentences are executed in the order of their appearance in the source program, however, you can change this by referring to a paragraph-name. You can jump from one procedure to another by saying GO TO paragraph-name.

Statements consist of a verb and its operands or several statements. Sentences consist of one or more such statements. Paragraphs consist of one or more sentences. Sections consist of one or more paragraphs.

THE CATEGORIES OF VERBS

All the verbs which may be used in the PROCEDURE DIVISION fall into one of three functional categories -- imperative, conditional, or compiler-directing.

ALTER is an imperative verb. IF is a conditional verb. COPY is a compiler-directing verb. Most of the verbs are imperative verbs. A verb which gives a direct processing instruction, such as ADD or READ, is called an imperative verb.

A verb which tests a condition, such as A = B, is called a conditional verb. The conditional verb IF creates conditional statements, and cannot appear in imperative statements.

A verb which instructs the compiler, at compilation time, rather than instructing the central processor during data processing, is called a compiler-directing verb. Statements using EXIT or COPY are compiler-directing statements.

The statement ADD A TO B ... is imperative. But the statement ADD A TO B; ON SIZE ERROR GO TO X-PROCEDURE is conditional. The statement READ FILE-A; AT END GO TO CLOSING-ROUTINE ... is conditional. Any statement starting with IF is conditional.

IF A = B GO TO ADD-ROUTINE ...

Basically, GO TO ADD-ROUTINE is an imperative statement. However, the statement shown is a conditional statement. Remember that statements may contain statements. A sentence is a statement or group of statements that are terminated by a period.

THE INPUT-OUTPUT VERBS

The transfer of data between peripheral device and memory can be a complicated subject. COBOL simplifies the matter by letting the compiler select all the ports, channels, appropriate devices, memory storage areas, etc. All the COBOL programmer need do is give the appropriate input or output instruction.

In the manual turn to the page devoted to the OPEN verb. (The verbs are arranged in alphabetical order.) The function of the verb is to initiate the processing of input and output files. Before an input file can be READ, certain standardized procedures may take place. The OPEN verb generates these standardized procedures.

Now turn to the CLOSE verb in your manual. The CLOSE verb is just the opposite of the OPEN verb. The OPEN verb initiates the processing of input and output files. The CLOSE verb terminates the processing of input and output files. Many times after you have CLOSED the files, you would STOP RUN. Turn to the STOP verb in your manual. The use of the STOP verb is to halt the object program either permanently or temporarily.

Now turn to the READ verb in your manual. To transfer a data record from an input file to memory storage, you use a READ instruction. A file may have many, many records, but only one at a time is made available. Every record in the file is stored in the same memory area as the last record was stored. A READ instruction does not destroy the previous record in the file, but it does destroy the previous record in memory. Since most programs loop back to a READ instruction, provisions must be made in the READ instruction

for running out of records in the file. This is done in the phrase AT END any imperative statement. The phrase AT END any imperative statement is required. This means that, even though you know the AT END will not be taken, you must include it.

READ DISK-IN; AT END IF TAX-INCOME IS GREATER THAN 8400
GO TO COMPUTE-WAGE-TAX.

The above sentence would cause a diagnostic at compilation time because the AT END branch is followed by a conditional statement when it should be followed by an imperative statement.

Now turn to the WRITE verb in your manual. The READ verb makes one record available. The write verb releases one record to an output device. To make the ACCOUNT-COPY record available to an output device, you would enter:

WRITE ACCOUNT-COPY.

Compare the READ and WRITE verbs. Notice that you READ a file-name but you WRITE a record-name.

MOVE VERB

An often used procedure in a source program is the transferal of data from one area in memory to another. For example, data can be transferred from memory area reserved for the input file to a memory area reserved for the output file. To execute this type of procedure, the MOVE verb is used.

Look at the MOVE verb format in the manual. Every MOVE verb references one "sending field" and at least one "receiving field". If you want to transfer the data stored in the field named CUSTOMERS-ACCOUNT to the data area ACCOUNT-OF-CUSTOMER, you write:

MOVE CUSTOMERS-ACCOUNT TO ACCOUNT-OF-CUSTOMER.

If you want to transfer the data in NEW-BALANCE to three different data areas, named CUSTOMER-BALANCE, CLOSING-BALANCE and AUDIT-BALANCE, you would make the following entry;

MOVE NEW-BALANCE TO CUSTOMER-BALANCE, CLOSING-BALANCE,
AUDIT-BALANCE.

When data is MOVED from a memory area, it is not removed from that area. Therefore, after the MOVE is executed, the data appears in at least two memory areas. The sending field and each receiving field. In the verb format for MOVE, you may use a literal. A literal is an item of data, the value of which is identical to those characters comprising the literal. As you know, a data-name refers to a memory area where a value is stored. Thus, the value of the data-name ACCOUNT-NUMBER may be 50321, or 27993, or any other number. However, the value of the literal 34729 can only be the number 34729. Usually, the programmer does not know the values he is dealing with, so he uses data-names and lets the computer find the values. If, however, he wishes to specify the exact characters to be processed, he uses a literal. There are two types of literals, nonnumeric and numeric. "1984" is a nonnumeric literal, while 1984 is a numeric literal.

Since data-names must contain at least 1 alphabetic character, numeric literals do not resemble data-names. That is 40325 must be a literal because it does not contain an alphabetic character.

Nonnumeric literals may tend to look like data-names, since they may be comprised of alphabetic characters. Therefore, to distinguish between nonnumeric literals and data-names, we put nonnumeric literals in quotation marks.

COST OF ITEM is an illegal data-name because it contains spaces. However, "COST OF ITEM" is acceptable as a nonnumeric literal. While nonnumeric literals may contain any allowable character, numeric literals may never contain alphabetic characters. A numeric literal may contain a (+) or (-) sign as its leftmost character. If no sign is used, the literal is assumed to be positive. If a numeric literal does not contain a decimal point, it is assumed to be an integer.

While nonnumeric literals may contain up to 120 characters, numeric literals contain no more than 18 characters.

The data to be transferred by a MOVE statement may be specified by a **figurative constant**. A figurative constant is a value that has been assigned a fixed data-name. No matter how many characters the receiving field contains, it will be filled with the value represented by the figurative constant. If we want to clear the memory area reserved for CUSTOMER-NAME, this means we want to replace any data there with spaces, we would write:

MOVE SPACES TO CUSTOMER-NAME.

If we wanted to fill the CUSTOMERS-ADDRESS field with X's. We would write:

MOVE ALL "X" TO CUSTOMER-ADDRESS.

If both the sending field and the receiving field are numeric, you would expect the MOVE to be numeric. If both the sending field and the receiving field are nonnumeric, the MOVE will be nonnumeric. However, if either the sending field or the receiving field is nonnumeric, the MOVE is nonnumeric.

Sometimes the sending field and the receiving field are not the same size. The results of such a MOVE depend on the description of the data you are moving. In the example below, the MOVE is a nonnumeric MOVE. The extra spaces are on the right side of the receiving field.

[JOHN JONES] [JOHN JONES]

When a receiving field is longer than the sending field, and the MOVE is nonnumeric, the righthand side of the receiving field is filled with spaces (blanks).

The coding generated for **numeric moves** is such as to move characters from the sending to the receiving field lining up the decimal point. Every number has a decimal point. If it doesn't show, it is to the right of the rightmost (least significant) digit.

When we use the symbol "V", it means the decimal point is "implied". (i.e., it is not actually present in the data field but the computer can align data by it.)

Some examples of decimal point alignment are shown below. As you can see, the computer can align real decimal points with other real decimal points, and implied decimal points with either implied or real decimal points.

[123.45]	[0123.450]
[123v45]	[0123.450]
[123v45]	[0123v4500]

A numeric MOVE is a 3-step process

1. Align the decimal points.
2. MOVE the digits.
3. Fill in zeros.

On the prior unequal MOVES the receiving field has been larger than the sending field. However, if the sending field is larger than the receiving field "Truncation" (the chopping off of extra characters) occurs.

[WILLIAM K. SMITH] [WILLIAM K. SM]

The above example shows that for nonnumeric MOVES, the extra characters will be truncated on the right side.

[1234.56] [34.5]

For numeric or edited MOVES, the extra characters may be truncated on both sides, depending on the decimal point alignments.

Subdivisions of a field are very handy in COBOL, because sometimes we may want to use the entire field and sometimes just part of a field. You may MOVE either group items or elementary items. Often, group items are set up for the very purpose of moving; i. e., we may want to process the customer's name individually. However, we know that we need to transfer all the data to the output master file. So we created a group name, CUSTOMERS-RECORD and, rather than writing 3 individual MOVE verbs, we can say

MOVE CUSTOMERS-RECORD TO...

In every file, the largest group item will be the record name. In an updating procedure, the input record and the output record will have exactly the same format. You can transfer the entire record from the input memory area to the output memory area by saying:

MOVE input-record-name TO output-record-name.

All group MOVES are nonnumeric.

THE ARITHMETIC VERBS

Most of the arithmetic functions of a business application can be handled by addition, subtraction, multiplication, and/or division. So, COBOL includes four arithmetic verbs ADD, SUBTRACT, MULTIPLY and DIVIDE.

Suppose we wanted to add 5 to the field named PRINTER-LINE-COUNT. We would write:

ADD 5 TO PRINTER-LINE-COUNT.

Look in the manual under ADD. Note that you may combine TO and GIVING. If you do, the sum is stored in the data-name following the word GIVING.

INPUT	OUTPUT
WAGE-TAX [3029v73]	DEDUCTIONS [9999v99]
FICA [7637v69]	

The fields on the left represent fields in memory used as operands. The field on the right represents a field in memory used as a receiving field. These fields are referable by the data-names next to them, although the data-names do not actually appear in memory. The fields are set up by data description entries in the DATA DIVISION. The "v" stands for the location of the decimal point. Add WAGE-TAX and FICA together. The sum is 10667v42. You cannot store the sum in DEDUCTIONS because it's too long and you will lose the 1. This is called a SIZE ERROR. Whenever arithmetic processes take place there is the possibility of a SIZE ERROR.

PRINCIPLE [0005023v7]	INTEREST [9999v99]
INT-RATE [v042]	

If we were to multiply PRINCIPLE by INT-RATE and store the sum in INTEREST, a SIZE ERROR would occur. You could not store the righthand digits.

Truncation of leftmost and/or rightmost digits of the sum can occur during the storage of the sum according to the size of the receiving field. The normal rules for truncation are:

- a. When the receiving field contains fewer integer places than the sum, truncation of the leftmost digits occurs.
- b. When the receiving field contains fewer decimal places than the sum, the truncation of rightmost digits occur.

As you can see, if a SIZE ERROR occurs, the sum will be stored but truncation will occur. The SIZE ERROR option is to detect left digit truncation. The programmer must specify how to store the sums and must supply any imperative

statement. Normally, more than one step is involved in preventing left truncation. Therefore, rather than specifying the procedures to be taken as part of the ADD sentence, you would branch to a subroutine.

The ROUNDED option is to prevent right digit truncation. The ROUNDED option automatically takes care of storing the sum.

Editing of Output Data

Numeric data which contains no extraneous symbols on input (ie, no real decimal points, commas, dollar signs, etc) may be edited on output. That is, symbols such as commas and dollar signs may be added to the data.

INPUT	OUTPUT
CUST-BAL [v]	NEW-BAL [\$.]
DEPOSITS [v]	

To edit data, the editing symbols are stored in the receiving fields. In the NEW-BAL receiving field a dollar sign and a decimal point are stored.

NUMERIC LITERALS

ADD "29" TO LINE-COUNT.

This is not legal. "29" is a nonnumeric literal; only numeric literals may be used.

ADD 14.21 TO X-FIELD.

This is legal. (14.21 is a numeric literal; the decimal point will be aligned with the implied decimal point of X-FIELD before addition takes place.)

Turn now to the **SUBTRACT** verb in your manual. As you can see, the SUBTRACT verb format is similar to the ADD verb format. Whereas, in the ADD verb, TO is optional, in the SUBTRACT verb, FROM is required.

GROSS-PAY - DEDUCTIONS = NET-PAY

To accomplish the above, you would enter SUBTRACT DEDUCTIONS FROM GROSS-PAY GIVING NET-PAY.

Now turn to the **MULTIPLY** verb. Again, the format is very similar to the ADD and SUBTRACT verbs. Like the SUBTRACT verb FROM, the word BY is required. Note that only two operands may be used, the multiplier (data-name-1) and the multiplicand (data-name-2).

In the multiplication process, MULTIPLY A BY B GIVING C and MULTIPLY B BY A GIVING C will produce same results. The

rightmost operand must be a data-name, since it will be the receiving field. Therefore, rather than saying MULTIPLY LINE-COUNT BY 2 you should say MULTIPLY 2 BY LINE-COUNT.

MULTIPLY LINE-COUNT BY 2 GIVING TALLY-LINES is permissible because the rightmost operand (the receiving field) is TALLY-LINES, which is a data-name.

Turn to the **DIVIDE** verb. The format is the same. In DIVIDE processes, the decimal places can often go on and on. Therefore, the number of places computed is not determined by the operands, but the receiving field. If the receiving field contains three decimal places, the DIVIDE process will generate three decimal digits.

Since enough digits are generated to fill the right hand portion of the field, there is no right truncation in the division process (although the effect is the same as right truncation). Division simply ceases at the appropriate time. However, left truncation can occur.

Anything divided by zero = infinity. You cannot DIVIDE by 0. Division by zero is regarded as a SIZE ERROR. If even a remote possibility exists, you must specify an ON SIZE ERROR option.

Recall that ROUNDED is used to prevent right truncation. Since no right truncation takes place in the DIVIDE process, the rules for ROUNDED option are different. ROUNDED will cause two more right hand digits to be generated. The two extra right hand digits created by the ROUNDED option are then rounded off, as normal.

THE SEQUENCE CONTROL VERBS

The normal sequence of executing a COBOL program is to start with the first statement after the words PROCEDURE DIVISION, execute that, pass control to the second statement, execute that, pass control to the third statement, etc. Sometimes you may wish to instruct the computer not to execute the statements in this "straight-line" sequence. In this case, depending on whether you want to permanently depart or only temporarily depart from the "straight-line" sequence, you may use the GO TO or the PERFORM verb.

Turn to the **GO TO** page of the manual. In a source program, procedural statements are written in the order in which the programmer decided they should be executed. To depart from this normal sequence of procedures, you may use the **GO TO** verb. The **GO TO** verb format consists of the words **GO TO** plus the desired procedure-name. To write the **GO TO** entry using the procedure-name **BEGIN**. You would write **GO TO BEGIN**. When this statement is encountered, the entire PROCEDURE DIVISION

is scanned for a paragraph or a section named BEGIN. Control is transferred to that paragraph or section.

Another sequence control verb is PERFORM. Whereas GO TO permanently transfers control, PERFORM only temporarily transfers control.

A subroutine must have one, and only one, EXIT point. If it logically has more than one, then you must change it so that it has only one exit point.

SUMMARY SECTION.

A-PARA.

```
MOVE IN-REC TO OUT-REC.  
WRITE OUT-REC.  
IF FLAG = 1 GO TO B-PARA.  
WRITE OUT-REC.
```

B-PARA. EXIT.

The statement says IF FLAG = 1 GO TO B-PARA.

B-PARA of SUMMARY subroutine contains one instruction EXIT. In many cases where a procedure has more than one path, the last statement will be the verb EXIT.

Since EXIT must be in a paragraph by itself, with a paragraph-name, the other procedures to be PERFORMed must be contained in at least one other paragraph. Since the PERFORM statement must reference the EXIT verb as well as the procedures to be PERFORMed, the PERFORM statement can reference a section-name. The section referenced will contain the procedural paragraph's plus the EXIT paragraph. Or another way would be to PERFORM ... THRU. In this case:

PERFORM A-PARA THRU B-PARA.

A command which will cause the ADD-DAILY-HOURS through the COMPUTE-DAILY-WAGE paragraphs to be executed five times in a row is written:

PERFORM ADD-DAILY-WAGE THRU COMPUTE-DAILY-WAGE 5 TIMES.

THE IF VERB

At many points in a program it is important to take different courses of action based on the results of a test. For example, in payroll computations, employees with over a certain amount of year-to-date earnings do not get charged social security tax, those under do. Some employees may have Blue Cross, Blue Shield, savings bonds, and other employee benefits charged. Others may not. Each of these would need a special test made to see if the deductions should be made.

Turn to the IF verb in your manual. Read the function. Remember that conditional statements have two forms the second form is represented by ON SIZE ERROR or AT END. IF represents the 1st form. Read the format of the IF statement. The first programmer-supplied information is condition. Look at the format for the entire IF statement. Following the condition the programmer either supplies statement-1 or writes the key words NEXT SENTENCE.

```
IF LINE-COUNT IS NOT LESS THAN 40 PERFORM PAGE-ROUTINE  
ELSE PERFORM SPACING-ROUTINE.  
WRITE HEADING-1.
```

The LINE-COUNT is tested and if 39 or less, the SPACING-ROUTINE is performed, and then the instruction WRITE HEADING-1 is processed. In fact, no matter what the results of the test, control is returned to the next sentence, WRITE HEADING-1.

Look at your manual. In order to pass control directly to the next sentence by statement-2, you would use the key words NEXT SENTENCE. You can also transfer control directly to the next sentence by statement-1. In this case, statement-1 would say NEXT SENTENCE. NEXT SENTENCE can be substituted for either statement-1 or statement-2. If substituted for statement-2, the whole clause ELSE NEXT SENTENCE can be omitted.

```
IF AMOUNT IS POSITIVE PERFORM DEPOSIT-ROUTINE.  
WRITE HEADING-1.
```

In the above conditional sentence, the compiler will assume that ELSE NEXT SENTENCE is missing. Therefore, if AMOUNT is not positive, control will be sent to the statement WRITE HEADING-1.

CONCLUSION

This has been a brief introduction to the COBOL language. Perhaps with the example programs that follow, it will be enough to get you started. The interested reader should consult one of the many COBOL self-teaching books available at most book stores. Good luck!

SOFTWARE LICENSE AGREEMENT

IMPORTANT: All Ellis Computing programs are sold only on the condition that the purchaser agrees to the following License.

ELLIS COMPUTING agrees to grant and the Customer agrees to accept on the following terms and conditions nontransferable and nonexclusive Licenses to use the software program(s) (Licensed Programs) herein delivered with this Agreement.

TERM:

This Agreement is effective from the date of receipt of the above-referenced program(s) and shall remain in force until terminated by the Customer upon one month's prior written notice, or by Ellis Computing as provided below.

Any License under this Agreement may be discontinued by the Customer at any time upon one month's prior written notice. Ellis Computing may discontinue any License or terminate this Agreement if the Customer fails to comply with any of the terms and conditions of this Agreement.

LICENSE:

Each program License granted under this Agreement authorizes the Customer to use the Licensed Program in any machine readable form on any single computer system (referred to as System). A separate license is required for each System on which the Licensed Program will be used.

This Agreement and any of the Licenses, programs or materials to which it applies may not be assigned, sublicensed or otherwise transferred by the Customer without prior written consent from Ellis Computing. No right to print or copy, in whole or in part, the Licensed Programs is granted except as hereinafter expressly provided.

PERMISSION TO COPY OR MODIFY LICENSED PROGRAMS:

The customer shall not copy, in whole or in part, any Licensed Programs which are provided by Ellis Computing in printed form under this Agreement. Additional copies of printed materials may be acquired from Ellis Computing.

The NEVADA COBOL COMPILER Licensed Programs which are provided by Ellis Computing in machine readable form may be copied, in whole or in part, in machine readable form in sufficient number for use by the Customer with the

designated System, for back-up purposes, or for archive purposes. The original, and any copies of the Licensed Programs, in whole or in part, which are made by the Customer shall be the property of Ellis Computing. This does not imply that Ellis Computing owns the media on which the Licensed Programs are recorded.

The NEVADA COBOL Licensed Program called "RUN" which is provided by Ellis Computing may be distributed to third parties.

The Customer agrees to reproduce and include the copyright notice of Ellis Computing on all copies, in whole or in part, in any form, including partial copies of modifications, of Licensed Programs made hereunder.

PROTECTION AND SECURITY:

The Customer agrees not to provide or otherwise make available the NEVADA COBOL COMPILER Program including but not limited to program listings, object code and source code, in any form, to any person other than Customer or Ellis Computing employees, without prior written consent from Ellis Computing, except with the Customer's permission for purposes specifically related to the Customer's use of the Licensed Program.

DISCLAIMER OF WARRANTY:

Ellis Computing makes no warranties with respect to the Licensed Programs.

LIMITATION OF LIABILITY:

THE FOREGOING WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. IN NO EVENT WILL ELLIS COMPUTING BE LIABLE FOR CONSEQUENTIAL DAMAGES EVEN IF ELLIS COMPUTING HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

GENERAL:

If any of the provisions, or portions thereof, of this Agreement are invalid under any applicable statute or rule of law, they are to that extent to be deemed omitted. This is the complete and exclusive statement of the Agreement between the parties which supersedes all proposals, oral or written, and all other communications between the parties relating to the subject matter of this Agreement. This Agreement will be governed by the laws of the State of California.
